COMPUTATIONAL GEOMETRY INTRODUCTION

PETRFELKEL FEL CTU PRAGUE felkel@fel.cvut.cz http://service.felk.cvut.cz/courses/X39VGE A4M39VG Http://service.felk.cvut.cz/courses/X39VGE A4M39VG Http://service.felk.cvut.cz/courses/X39VGE Version from 29.9.2011

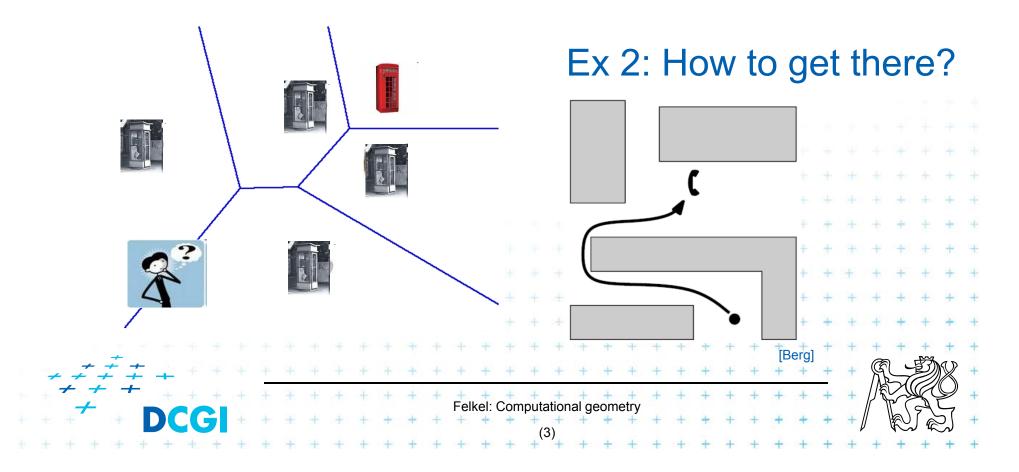

Computational Geometry

- 1. What is Computational Geometry (CG)?
- 2. Why to study CG?
- 3. Typical application domains
- 4. Typical tasks
- 5. Complexity of algorithms
- 6. Programming techniques (paradigms) of CG

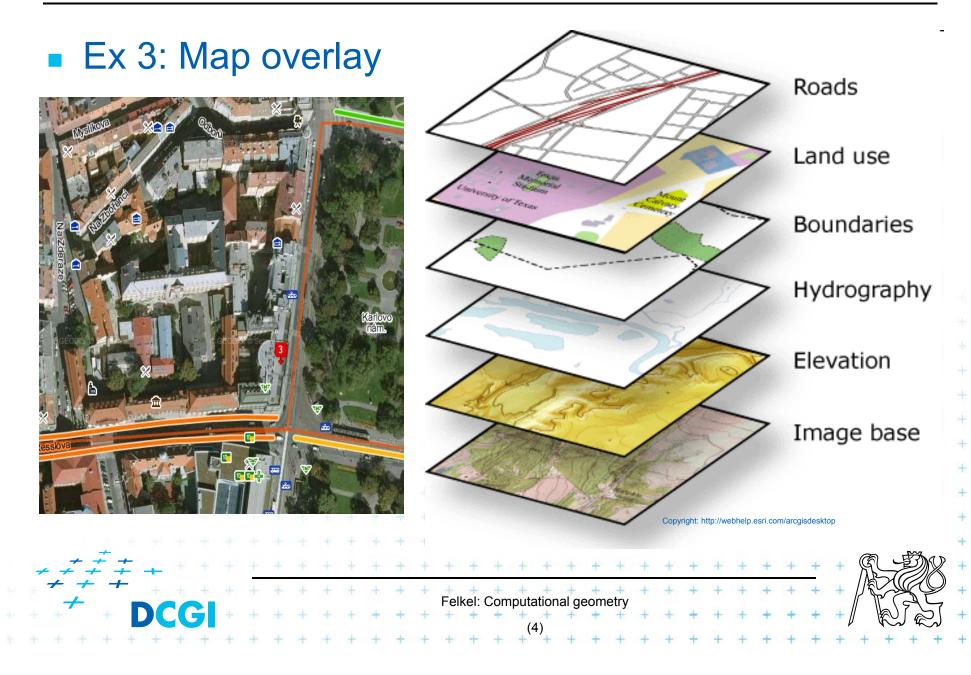

- 7. CGAL CG algorithm library intro
- 8. References and resources
- 9. Course summary

1. What is Computational Geometry?

- CG Solves geometric problems that require clever geometric algorithms
- Ex 1: Where is the nearest phone, metro, pub,...?

1.1 What is Computational Geometry? (...)

1.2 What is Computational Geometry? (...)

- Good solutions need both:
 - Understanding of the geometric properties of the problem
- Proper applications of algorithmic techniques (paradigms) and data structures
 Felkel: Computational geometry (5)

1.3 What is Computational Geometry? (...)

Computational geometry

= systematic study of algorithms and data structures for geometric objects (points, lines, line segments, n-gons,...) with focus on exact algorithms that are asymptotically fast

"Born" in 1975 (Shamos), boom of papers in 90s
 (first papers sooner: 1850 Dirichlet, 1908 Voronoi,...)

Felkel: Computational geometry

 Many problems can be formulated geometrically (e.g., range queries in databases)

1.4 What is Computational Geometry? (...)

Problems:

- Degenerate cases (points on line, with same x,...)
 - ignore first, include later

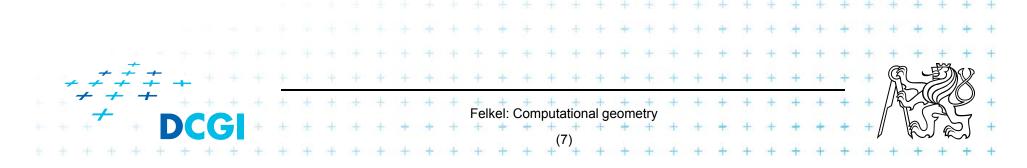

Robustness - correct algorithm but not robust

- Limited numerical precision of real arithmetic
- Inconsistent eps tests (a=b, b=c, but aûc)

Nowadays:

 focus on practical implementations, not just on asymptotically fastest algorithms

nearly correct result is better than nonsense or crash

2. Why to study computational geometry?

- Graphics- and Vision- Engineer should know it ("DSA in nth-Dimension")
- Set of ready to use tools
- You will know much more to choose from
- Typical teaching method: statement-proof

3. Typical application domains

- Computer graphics
 - Collisions of objects
 - Mouse localization
 - Selection of objects in region
 - Visibility in 3D (hidden surface removal)
 - Computation of shadows

Robotics

- Motion planning (find path - environment with obstacles)

Felkel: Computational geometr

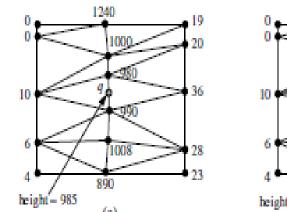

[Farag]

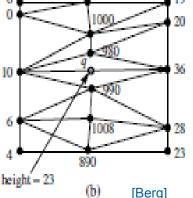

- Task planning (motion + planning order of subtasks)
- Design of robots and working cells

3.1 Typical application domains (...)

GIS

- How to store huge data and search them quickly
- Interpolation of heights
- Overlap of different data

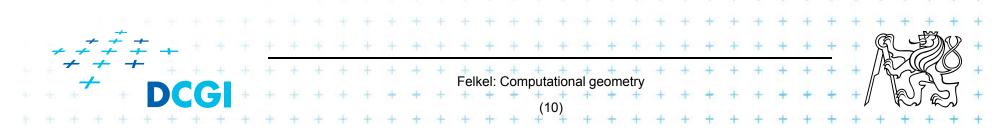

1240

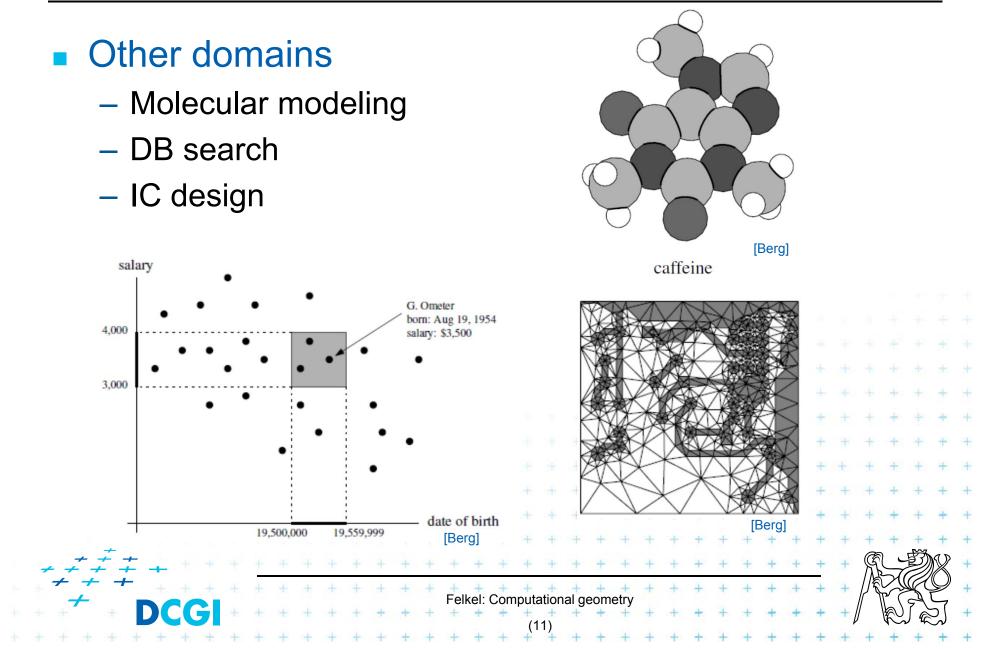

- Extract information about regions or relations between data (pipes under the construction site, plants x average rainfall,...
- Detect bridges on crossings of roads and rivers...

CAD/CAM

- Intersections and unions of objects
- Visualization and tests without need to build a prototype
- Manufacturability

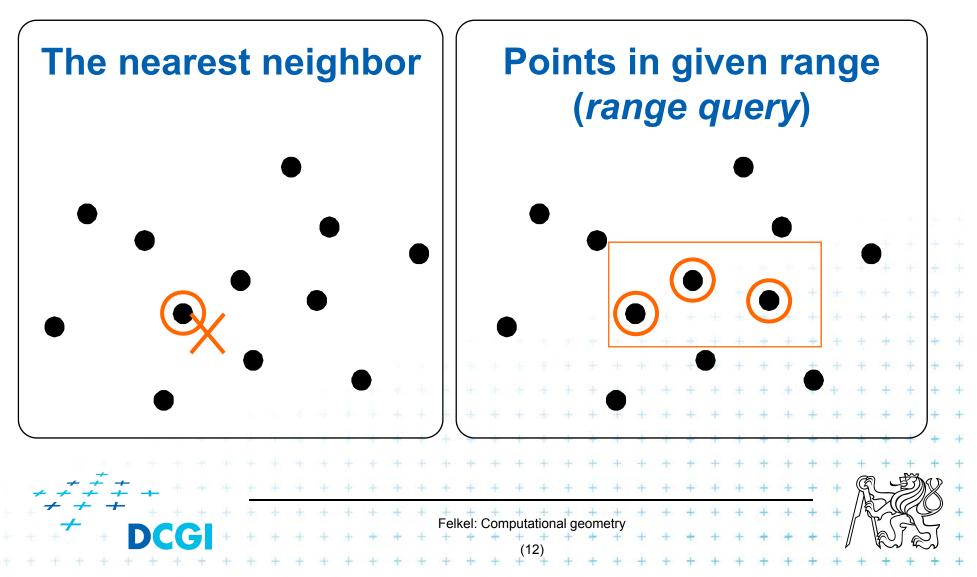

3.2 Typical application domains (...)

4. Typical tasks in CG

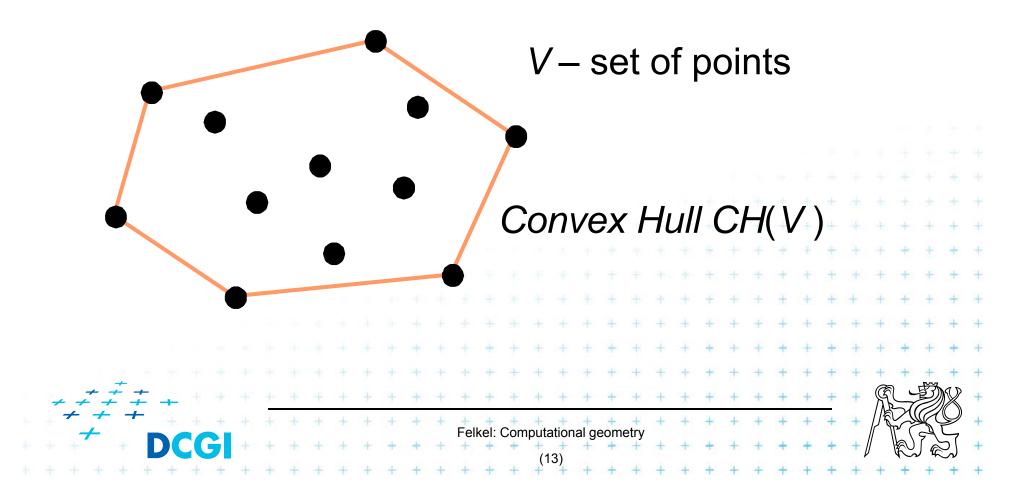

Geometric searching - fast location of :

4.1 Typical tasks in CG

Convex hull

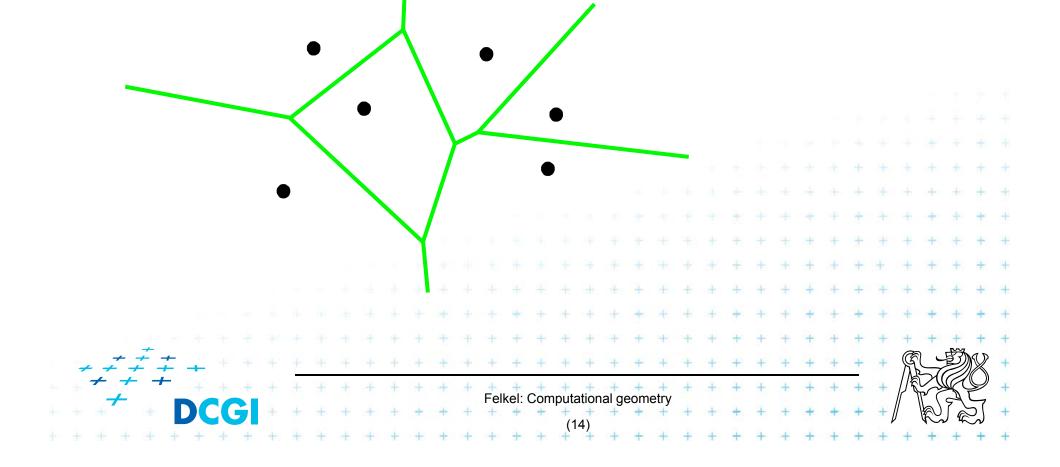

= smallest enclosing convex polygon in E² or n-gon in E³ containing all the points

4.2 Typical tasks in CG

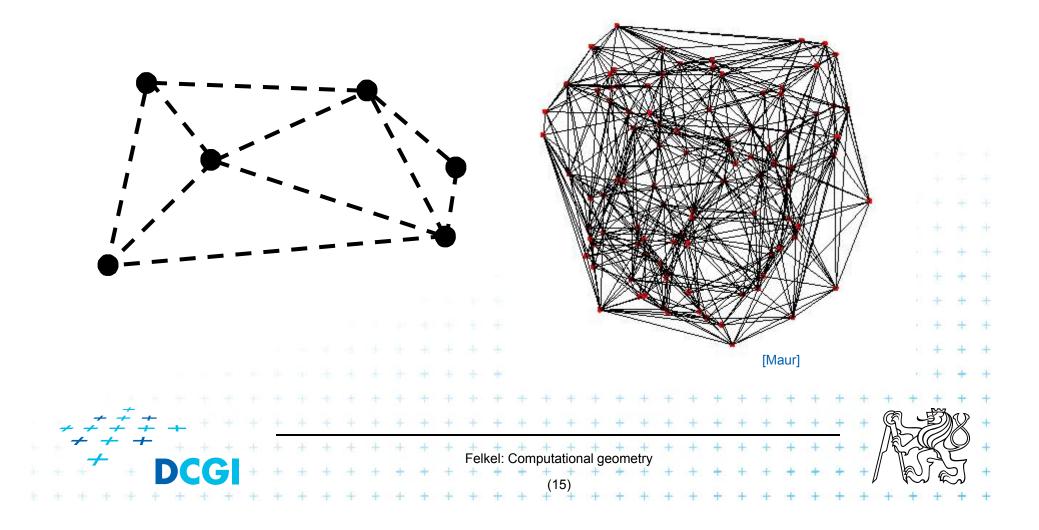

Voronoi diagrams

 Space (plane) partitioning into regions whose points are nearest to the given primitive (most usually a point)

4.3 Typical tasks in CG

 Planar triangulations and space tetrahedronization of given point set

4.4 Typical tasks in CG

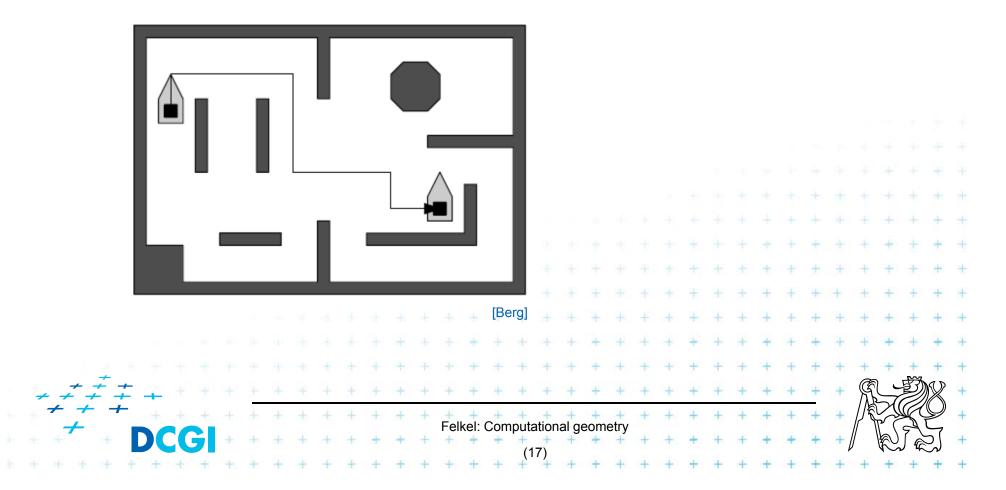

Intersection of objects

- Detection of common parts of objects
- Usually linear (line segments, polygons, n-gons,...)

4.5 Typical tasks in CG

- Motion planning
 - Search for the shortest path between two points in the environment with obstacles

5. Complexity of algorithms

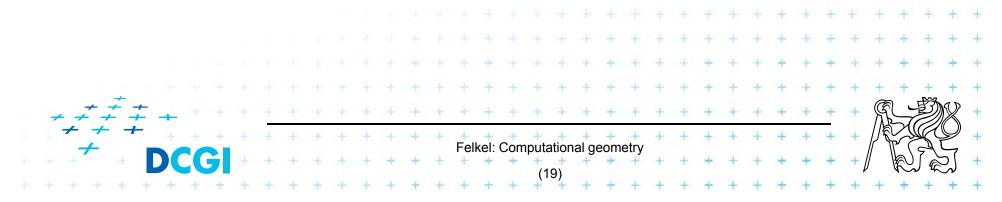

- We need a measure for comparison of algorithms
 - Independent on computer HW and prog. language
 - Dependent on problem size n
 - Describing the behavior of algorithm for different data
- Running time, preprocessing time, memory size
 - Asymptotical analysis O(g(n)), Z(g(n)), T(g(n))
 - Measurement on real data
 Differentiate:

 complexity of the algorithm and
 complexity of the problem

 given by number of edges, vertices, faces,...
 equal to the complexity of the best algorithm

5.1 Complexity of algorithms

- Worst case behavior
 - Running time for the "worst" data
- Expected behavior (average)
 - expectation of the running time for problems of particular size and probability distribution of input data
 - Valid only if the probability distribution is the same as expected during the analysis
 - Typically much smaller than the worst case behavior
 - Ex.: Quick sort $O(n^2)$ worst and $O(n \log n)$ expected

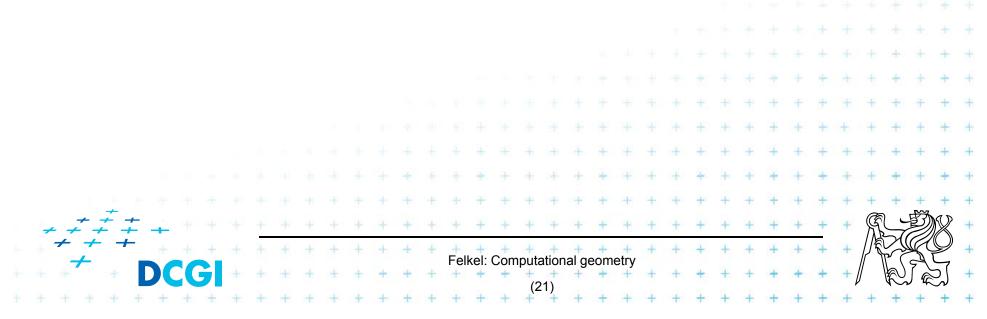

6. Programming techniques (paradigms) of CG

- 3 phases of a geometric algorithm development
 - 1. Ignore all degeneracies and design an algorithm
 - 2. Adjust the algorithm to be correct for degenerate cases
 - Degenerate input exists
 - Integrate special cases in general case
 - It is better than lot of case-switches (typical for beginners)
 - e.g.: lexicographic order for points on vertical lines or Symbolic perturbation schemes
 Implement alg. 2 (use sw library)

6.1 Sorting

- A preprocessing step
- Simplifies the following processing steps
- Sort according to:
 - coordinates x, y,..., or lexicographically to [y,x],
 - angles around point
- O(n logn) time and O(n) space

6.2 Divide and Conquer (divide et impera)

Split the problem until it is solvable, merge results

DivideAndConquer(S)

- 1. If known solution then return it
- 2. else
- 3. Split input S to k distinct subsets S_i
- 4. Foreach *i* call DivideAndConquer(S_i)
- 5. Merge the results and return the solution

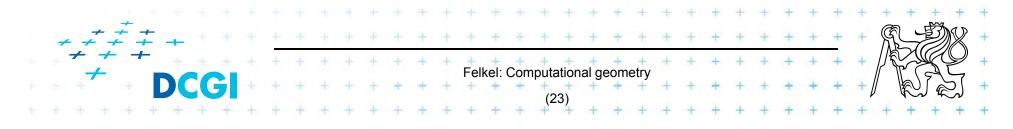

Prerequisite

- The input data set must be separable
- Solutions of subsets are independent
- The result can be obtained by merging of sub-results

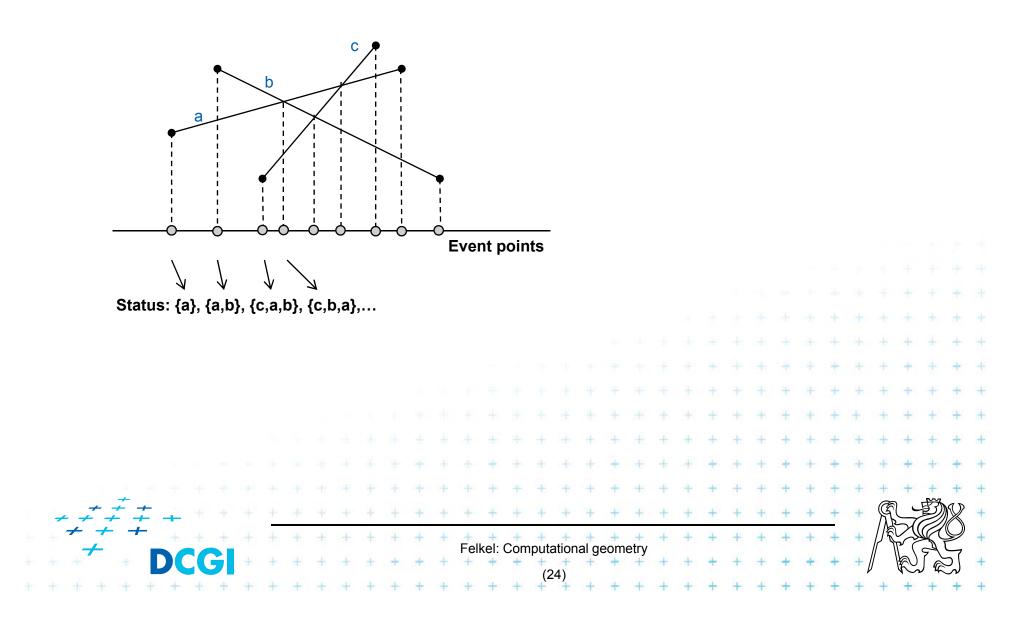

6.3 Sweep algorithm

• Split the space by a hyperplane (2D: sweep line)

- "Left" subspace solution known
- "Right" subspace solution unknown
- Stop in event points and update the status
- Data structures:
 - Event points points, where to stop the sweep line and update the status, sorted
 - Status state of the algorithm in current position of the sweep line
- Prerequisite:
 - Left subspace does not influence the right subspace

6.3b Sweep-line algorithm

6.4 Prune and search

 Eliminate parts of the state space, where the solution clearly does not exist

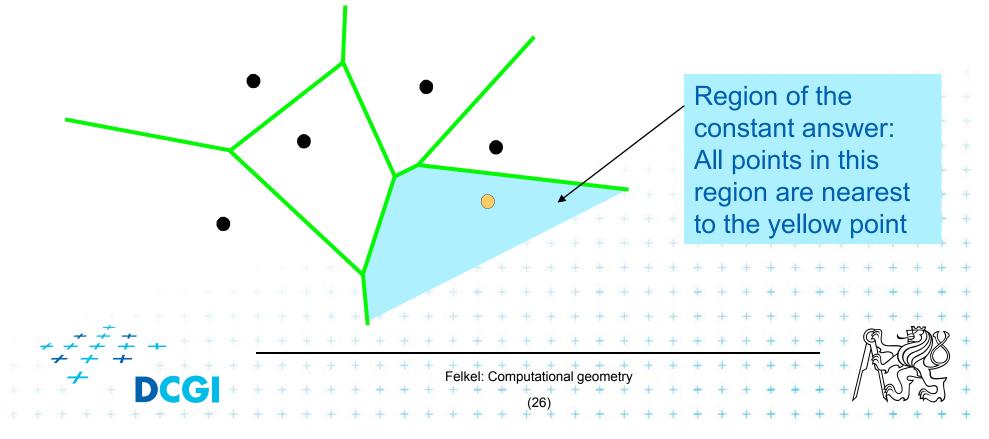

- Binary search

Search trees

Back-tracking (stop if solution worse than current optimum)

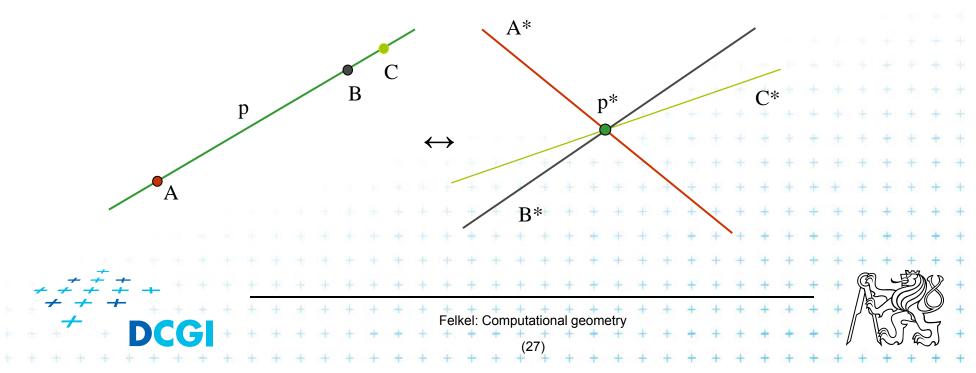

6.5 Locus approach

- Subdivide the search space into regions of constant answer
- Use point location to determine the region
 - Nearest neighbor search example

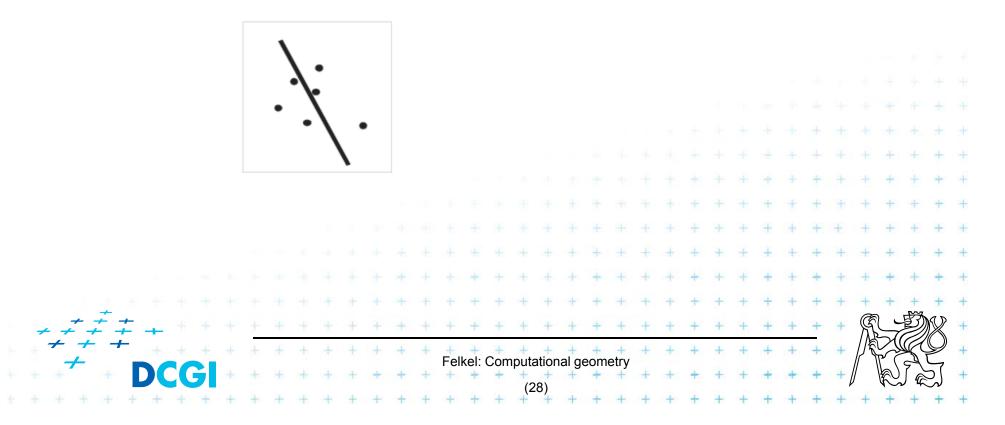

6.6 Dualisation

- Use geometry transform to change the problem into another that can be solved more easily
- Points ↔ hyper planes
 - Preservation of incidence (A μ p ² p* μ A*)
- Ex. 2D: determine if 3 points lie on a common line

6.7 Combinatorial analysis

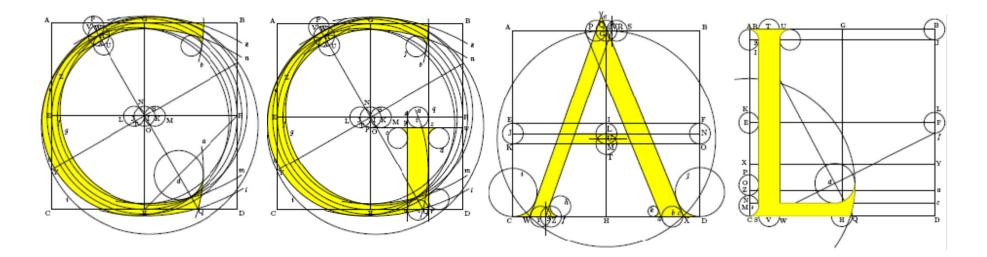

- = The branch of mathematics which studies the number of different ways of arranging things
- Ex. How many subdivisions of a point set can be done by one line?

6.8 New trends in Computational geometry

- From 2D to 3D and more from mid 80s, from linear to curved objects
- Focus on line segments, triangles in E³ and hyper planes in E^d
- Strong influence of combinatorial geometry
- Randomized algorithms
- Space effective algorithms (in place, in situ, data stream algs.)
- Robust algorithms and handling of singularities
- Practical implementation in libraries (LEDA, CGAL,

Computational Geometry Algorithms Library

Slides from [siggraph2008-CGAL-course]

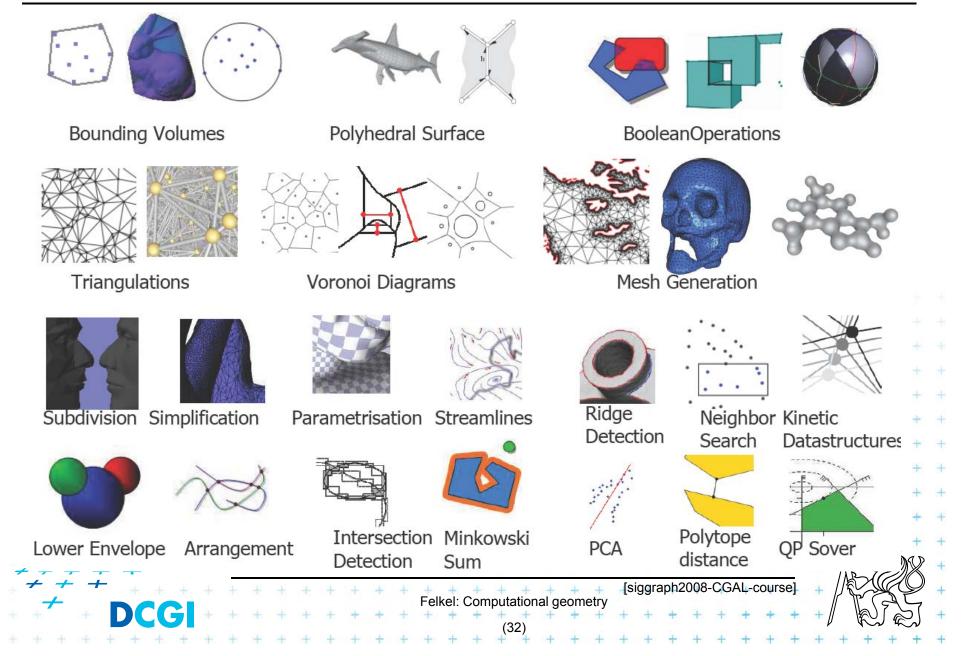

CGAL

Large library of geometric algorithms

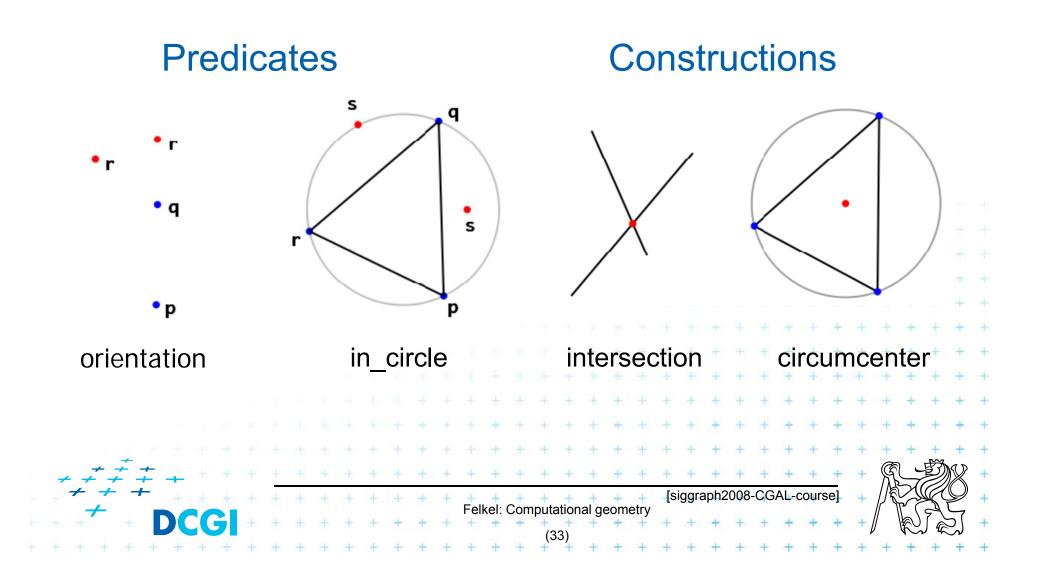

- Robust code
- Users can concentrate on their own domain
- Open source project
 - Institutional members
 (Inria, MPI, Tel-Aviv U, Utrecht U, Groningen U, ETHZ, Geometry Factory, FU Berlin, Forth, U Athens)

- 500,000 lines of C++ code
- 10,000 downloads/year (+ Linux distributions)
- 20 active developers
- 12 months release cycle

CGAL algorithms and data structures

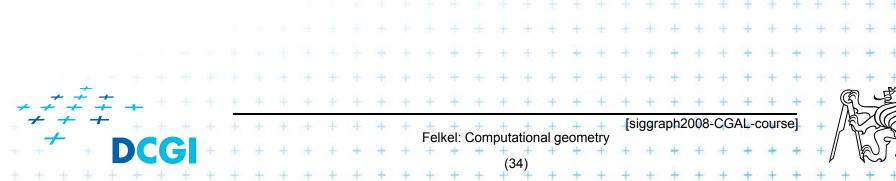

Exact geometric computing

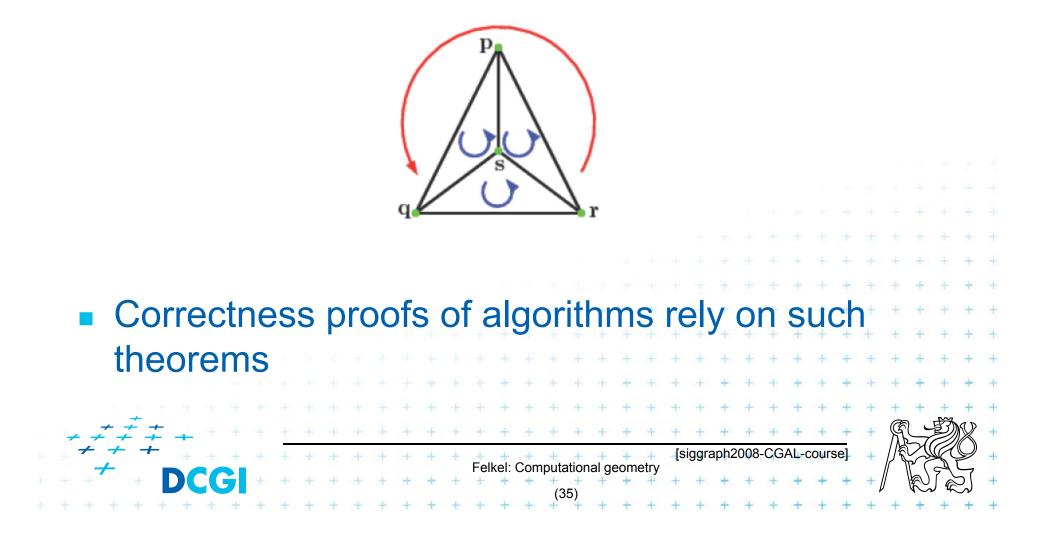

Robustness Issues

- Geometry in theory is exact
- Geometry with floating-point arithmetic is not exact
 - Limited numerical precision of real arithmetic
 - Inconsistent eps tests (a=b, b=c, but aûc)
- Naïve use of floating point arithmetic causes geometric algorithm to
 - Produce (slightly) wrong output
 - Crash after invariant violation
 - Infinite loop

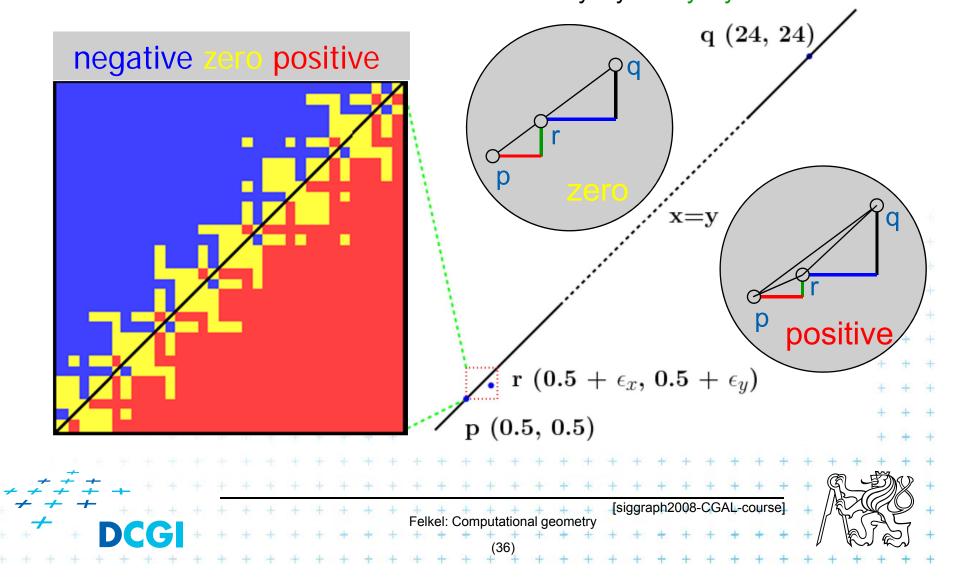

Geometry in Theory

ccw(s,q,r) & ccw(p,s,r) & ccw(p,q,s) => ccw(p,q,r)

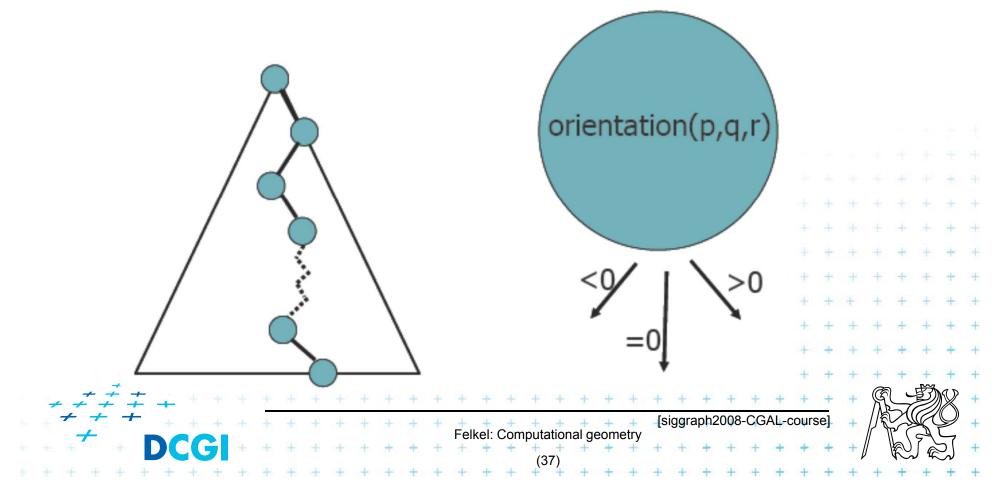

The Trouble with Double – point to line relation

• orientation(p,q,r) = sign($(p_x-r_x)(q_y-r_y)-(p_y-r_y)(q_x-r_x)$)

Exact Geometric Computing [Yap]

 Make sure that the control flow in the implementation corresponds to the control flow with exact real arithmetic

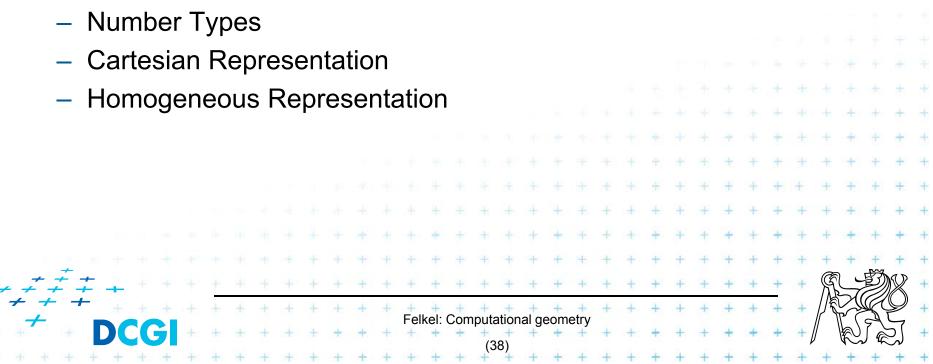

CGAL Geometric Kernel (see [Hert] for details)

Encapsulates

- the representation of geometric objects
- and the geometric operations and predicates on these objecrts

CGAL provides kernels for

- Points, Predicates, and Exactness

Points, predicates, and Exactness

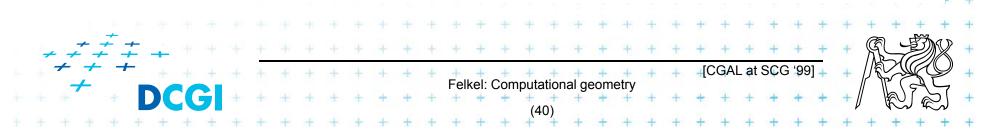

```
#include "tutorial.h"
#include <CGAL/Point_2.h>
#include <CGAL/predicates_on_points_2.h>
#include <iostream>
int main() {
    Point p( 1.0, 0.0);
    Point q( 1.3, 1.7);
    Point r( 2.2, 6.8);
    switch ( CGAL::orientation( p, q, r)) {
                                  std::cout << "Left turn.\n";</pre>
         case CGAL::LEFTTURN:
                                                                    break;
                                  std::cout << "Right turn.\n"; break;</pre>
         case CGAL::RIGHTTURN:
                                  std::cout << "Collinear.\n";</pre>
         case CGAL::COLLINEAR:
                                                                    break:
    return 0;
                                                          at SCG '991 +
                                 Felkel: Computational geometry
```

Number Types

- Builtin: double, float, int, long, ...
- CGAL: Filtered_exact, Interval_nt, ...
- LEDA: leda_integer, leda_rational, leda_real, ...
- Gmpz: CGAL::Gmpz
- others are easy to integrate

Coordinate Representations

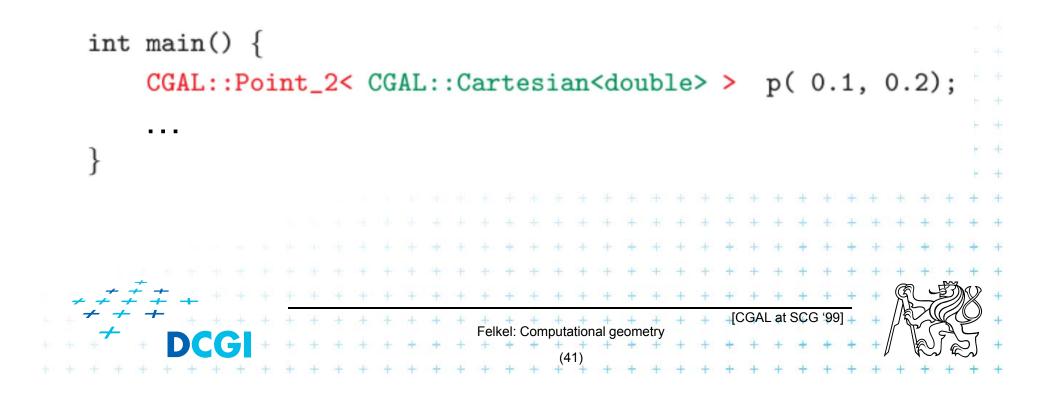

- Cartesian p = (x, y) : CGAL::Cartesian<Field_type>
- Homogeneous $p = (\frac{x}{w}, \frac{y}{w})$: CGAL::Homogeneous<Ring_type>

Precission x slow-down

Cartesian with double

#include <CGAL/Cartesian.h>
#include <CGAL/Point_2.h>

Cartesian with double

#include <CGAL/Cartesian.h>
#include <CGAL/Point_2.h>

```
typedef CGAL::Cartesian<double> Rep;
typedef CGAL::Point_2<Rep> Point;
```

```
int main() {
    Point p( 0.1, 0.2);
    ....
}

Felkel: Computational geometry
    (42)
```

Cartesian with Filtered_exact and leda_real

```
#include <CGAL/Cartesian.h>
#include <CGAL/Arithmetic_filter.h>
#include <CGAL/leda_real.h>
#include <CGAL/Point_2.h>
```

```
typedef CGAL::Filtered_exact<double, leda_real> NT;
typedef CGAL::Cartesian<NT>
                                                   Rep;
typedef CGAL::Point_2<Rep>
                                                   Point:
int main()
           p(0.1, 0.2);
    Point
                            One single-line declaration
                                    changes the
                           precision of all computations
                          Felkel: Computational geometry
```

Exact orientation test

```
#include <CGAL/Homogeneous.h>
#include <CGAL/Point_2.h>
#include <CGAL/predicates_on_points_2.h>
#include <iostream>
typedef CGAL::Homogeneous<long>
                                           Rep;
typedef CGAL::Point_2<Rep>
                                           Point:
int main() {
    Point p( 10, 0, 10);
    Point q( 13, 17, 10);
    Point r( 22, 68, 10);
    switch ( CGAL::orientation( p, q, r)) {
                                 std::cout << "Left turn.\n";</pre>
        case CGAL::LEFTTURN:
                                                                  break;
        case CGAL::RIGHTTURN:

9. Computational geom. course summary

- Gives an overview of geometric algorithms
- Explains their complexity and limitations
- Different algorithms for different data
- We focus on
 - discrete algorithms and precise numbers
 - principles more than on precise mathematical proofs
- Practical experiences by using CGAL library
 - Huge amount of algorithms "on-the-shelf"
 - Control over robustness and precision of computations
