### ► Canonical Perspective Camera (Pinhole Camera, Camera Obscura)

- 1. in this picture we are looking 'down the street'
- 2. right-handed canonical coordinate system (x, y, z) with unit vectors  $\mathbf{e}_x$ ,  $\mathbf{e}_y$ ,  $\mathbf{e}_z$
- **3**. origin = center of projection C
- 4. image plane  $\pi$  at unit distance from C
- 5. optical axis O is perpendicular to  $\pi$
- 6. principal point  $x_p$ : intersection of O and  $\pi$
- 7. perspective camera is given by C and  $\pi$

3D Computer Vision: II. Perspective Camera (p. 27/189) つへや

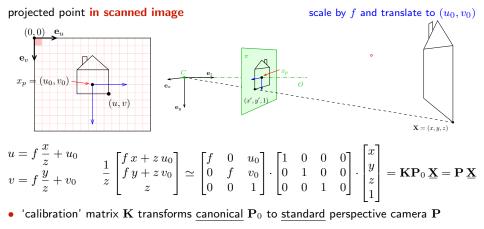

projected point in the natural image coordinate system:

$$\frac{y'}{1} = y' = \frac{y}{1+z-1} = \frac{y}{z}, \qquad x' = \frac{x}{z}$$

R. Šára, CMP; rev. 9-Oct-2018

### ► Natural and Canonical Image Coordinate Systems

projected point in canonical camera 
$$(z \neq 0)$$
  
 $(x', y', 1) = \left(\frac{x}{z}, \frac{y}{z}, 1\right) = \frac{1}{z}(x, y, z) \simeq \underbrace{\begin{bmatrix} 1 & 0 & 0 & 0\\ 0 & 1 & 0 & 0\\ 0 & 0 & 1 & 0 \end{bmatrix}}_{\mathbf{P}_0} \cdot \begin{bmatrix} x\\ y\\ z\\ 1 \end{bmatrix} = \mathbf{P}_0 \mathbf{X}$ 

### ► Computing with Perspective Camera Projection Matrix

$$\underline{\mathbf{m}} = \begin{bmatrix} m_1 \\ m_2 \\ m_3 \end{bmatrix} = \underbrace{\begin{bmatrix} f & 0 & u_0 & 0 \\ 0 & f & v_0 & 0 \\ 0 & 0 & 1 & 0 \end{bmatrix}}_{\mathbf{P}} \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix} \simeq \begin{bmatrix} fx + u_0z \\ fy + v_0z \\ z \end{bmatrix} \qquad \simeq \underbrace{\begin{bmatrix} x + \frac{z}{f}u_0 \\ y + \frac{z}{f}v_0 \\ z \end{bmatrix}}_{\mathbf{(a)}}$$

$$\frac{m_1}{m_3} = \frac{f \, x}{z} + u_0 = u, \qquad \frac{m_2}{m_3} = \frac{f \, y}{z} + v_0 = v \quad \text{when} \quad m_3 \neq 0$$

f – 'focal length' – converts length ratios to pixels,  $\ [f]={\rm px},\ f>0$   $(u_0,v_0)$  – principal point in pixels

#### **Perspective Camera:**

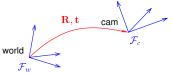

- 1. dimension reduction since  $\mathbf{P} \in \mathbb{R}^{3,4}$
- 2. nonlinear unit change  $\mathbf{1} \mapsto \mathbf{1} \cdot z/f$ , see (a) for convenience we use  $P_{11} = P_{22} = f$  rather than  $P_{33} = 1/f$  and the  $u_0, v_0$  in relative units
- 3.  $m_3 = 0$  represents points at infinity in image plane  $\pi$  i.e. points with z = 0

# ► Changing The Outer (World) Reference Frame

A transformation of a point from the world to camera coordinate system:

$$\mathbf{X}_c = \mathbf{R} \, \mathbf{X}_w + \mathbf{t}$$

 $\mathbf{R}$  – camera rotation matrix  $\mathbf{t}$  – camera translation vector

world orientation in the camera coordinate frame  $\mathcal{F}_c$  world origin in the camera coordinate frame  $\mathcal{F}_c$ 

$$\mathbf{P}\,\underline{\mathbf{X}}_{c} = \mathbf{K}\mathbf{P}_{0}\begin{bmatrix}\mathbf{X}_{c}\\1\end{bmatrix} = \mathbf{K}\mathbf{P}_{0}\begin{bmatrix}\mathbf{R}\mathbf{X}_{w} + \mathbf{t}\\1\end{bmatrix} = \mathbf{K}\mathbf{P}_{0}\underbrace{\begin{bmatrix}\mathbf{R} & \mathbf{t}\\\mathbf{0}^{\top} & 1\end{bmatrix}}_{\mathbf{T}}\begin{bmatrix}\mathbf{X}_{w}\\1\end{bmatrix} = \mathbf{K}\begin{bmatrix}\mathbf{R} & \mathbf{t}\end{bmatrix}\underline{\mathbf{X}}_{w}$$

 $\mathbf{P}_0$  (a  $3\times 4$  mtx) selects the first 3 rows of  $\mathbf T$  and discards the last row

- R is rotation,  $\mathbf{R}^{\top}\mathbf{R} = \mathbf{I}$ , det  $\mathbf{R} = +1$   $\mathbf{I} \in \mathbb{R}^{3,3}$  identity matrix
- 6 extrinsic parameters: 3 rotation angles (Euler theorem), 3 translation components
- alternative, often used, camera representations

 $\mathbf{C}_{-}$  – camera position in the world reference frame  $\mathcal{F}_w$   $\mathbf{r}_3^{-}$  – optical axis in the world reference frame  $\mathcal{F}_w$ 

$$\mathbf{P} = \mathbf{K} \begin{bmatrix} \mathbf{R} & \mathbf{t} \end{bmatrix} = \mathbf{K} \mathbf{R} \begin{bmatrix} \mathbf{I} & -\mathbf{C} \end{bmatrix}$$

 $\label{eq:tau} \begin{array}{l} \mathbf{t} = -\mathbf{R}\mathbf{C} \\ \text{third row of } \mathbf{R} : \ \mathbf{r}_3 = \mathbf{R}^{-1}[0,0,1]^\top \end{array}$ 

• we can save some conversion and computation by noting that  $\mathbf{KR}ig[\mathbf{I} \quad -\mathbf{C}ig] \, \mathbf{\underline{X}} = \mathbf{KR}(\mathbf{X}-\mathbf{C})$ 

# ► Changing the Inner (Image) Reference Frame

#### The general form of calibration matrix ${\bf K}$ includes

- skew angle  $\theta$  of the digitization raster
- pixel aspect ratio a

$$\mathbf{K} = \begin{bmatrix} f & -f \cot \theta & u_0 \\ 0 & f/(a \sin \theta) & v_0 \\ 0 & 0 & 1 \end{bmatrix}$$

units: [f] = px,  $[u_0] = px$ ,  $[v_0] = px$ , [a] = 1

#### general finite perspective camera has 11 parameters:

- 5 intrinsic parameters: f,  $u_0$ ,  $v_0$ , a, heta
- 6 extrinsic parameters: **t**,  $\mathbf{R}(\alpha, \beta, \gamma)$

, 
$$\mathbf{L}(\alpha, \beta, \gamma)$$

$$\underline{\mathbf{m}} \simeq \mathbf{P}\underline{\mathbf{X}}, \qquad \mathbf{P} = \begin{bmatrix} \mathbf{Q} & \mathbf{q} \end{bmatrix} = \mathbf{K} \begin{bmatrix} \mathbf{R} & \mathbf{t} \end{bmatrix} = \mathbf{K}\mathbf{R} \begin{bmatrix} \mathbf{I} & -\mathbf{C} \end{bmatrix}$$

a recipe for filling P

finite camera: det  $\mathbf{K} \neq 0$ 

Representation Theorem: The set of projection matrices  $\mathbf{P}$  of finite perspective cameras is isomorphic to the set of homogeneous  $3 \times 4$  matrices with the left  $3 \times 3$  submatrix  $\mathbf{Q}$  non-singular.

### ▶ Projection Matrix Decomposition

	$\mathbf{P} = egin{bmatrix} \mathbf{Q} & \mathbf{q} \end{bmatrix}  \longrightarrow  \mathbf{K} egin{bmatrix} \mathbf{R} & \mathbf{t} \end{bmatrix}$
$\mathbf{Q} \in \mathbb{R}^{3,3}$	full rank (if finite perspective camera)
$\mathbf{K} \in \mathbb{R}^{3,3}$	upper triangular with positive diagonal entries
$\mathbf{R} \in \mathbb{R}^{3,3}$	rotation: $\mathbf{R}^{\top}\mathbf{R} = \mathbf{I}$ and det $\mathbf{R} = +1$

**1.**  $\begin{bmatrix} \mathbf{Q} & \mathbf{q} \end{bmatrix} = \mathbf{K} \begin{bmatrix} \mathbf{R} & \mathbf{t} \end{bmatrix} = \begin{bmatrix} \mathbf{K} \mathbf{R} & \mathbf{K} \mathbf{t} \end{bmatrix}$  also  $\rightarrow 34$ 

2. RQ decomposition of Q = KR using three Givens rotations [H&Z, p. 579]

$$\mathbf{K} = \mathbf{Q} \underbrace{\mathbf{R}_{32}\mathbf{R}_{31}\mathbf{R}_{21}}_{\mathbf{R}^{-1}}$$

 $\mathbf{R}_{ij}$  zeroes element ij in  $\mathbf{Q}$  affecting only columns i and j and the sequence preserves previously zeroed elements, e.g. (see next slide for derivation details)

$$\mathbf{R}_{32} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & c & -s \\ 0 & s & c \end{bmatrix} \text{ gives } \begin{array}{c} c^2 + s^2 = 1 \\ 0 = k_{32} = c q_{32} + s q_{33} \end{array} \Rightarrow c = \frac{q_{33}}{\sqrt{q_{32}^2 + q_{33}^2}} \quad s = \frac{-q_{32}}{\sqrt{q_{32}^2 + q_{33}^2}}$$

 $\circledast$  P1; 1pt: Multiply known matrices K, R and then decompose back; discuss numerical errors

- RQ decomposition nonuniqueness: KR = KT<sup>-1</sup>TR, where T = diag(-1, -1, 1) is also a rotation, we must correct the result so that the diagonal elements of K are all positive 'thin' RQ decomposition
- care must be taken to avoid overflow, see [Golub & van Loan 2013, sec. 5.2]

#### **RQ** Decomposition Step

$$\begin{split} & Q = Array ~ [~q_{m1,\,m2}~\&,~\{~3,~3~\}~]; \\ & R32 ~ = ~ \{ \{1,~0,~0~\},~\{0,~c,~-s\},~\{0,~s,~c~\} \}; ~ R32 ~ // ~ MatrixForm \end{split}$$

 $\begin{pmatrix} 1 & 0 & 0 \\ 0 & c & -s \\ 0 & s & c \end{pmatrix}$ 

Q1 = Q.R32 ; Q1 // MatrixForm

 $\begin{pmatrix} q_{1,1} & c & q_{1,2} + s & q_{1,3} & -s & q_{1,2} + c & q_{1,3} \\ q_{2,1} & c & q_{2,2} + s & q_{2,3} & -s & q_{2,2} + c & q_{2,3} \\ q_{3,1} & c & q_{3,2} + s & q_{3,3} & -s & q_{3,2} + c & q_{3,3} \end{pmatrix}$ 

s1 = Solve [{Q1 [[3]][[2]] = 0, c^2 + s^2 = 1}, {c, s}][[2]]

$$\left\{ c \rightarrow \frac{q_{3,3}}{\sqrt{q_{3,2}^2 + q_{3,3}^2}}, s \rightarrow -\frac{q_{3,2}}{\sqrt{q_{3,2}^2 + q_{3,3}^2}} \right\}$$

Q1 /. s1 // Simplify // MatrixForm

$$\begin{pmatrix} q_{1,1} & \frac{-q_{1,2} \cdot q_{3,2} \cdot q_{1,2} \cdot q_{3,2}}{\sqrt{q_{3,2}^2 \cdot q_{3,3}^2}} & \frac{q_{1,2} \cdot q_{3,2} \cdot q_{1,2} \cdot q_{3,3}}{\sqrt{q_{3,2}^2 \cdot q_{3,3}^2}} \\ q_{2,1} & \frac{-q_{2,1} \cdot q_{3,2} \cdot q_{2,2} \cdot q_{3,3}}{\sqrt{q_{3,2}^2 \cdot q_{3,3}^2}} & \frac{q_{2,2} \cdot q_{3,2} \cdot q_{2,3} \cdot q_{3,3}}{\sqrt{q_{3,2}^2 \cdot q_{3,3}^2}} \\ q_{3,1} & 0 & \sqrt{q_{3,2}^2 \cdot q_{3,3}^2} \end{pmatrix}$$

3D Computer Vision: II. Perspective Camera (p. 33/189) つへや

## ► Center of Projection

#### Observation: finite P has a non-trivial right null-space

#### Theorem

Let **P** be a camera and let there be  $\underline{B} \neq 0$  s.t.  $\underline{P} \underline{B} = 0$ . Then  $\underline{B}$  is equivalent to the projection center  $\underline{C}$  (homogeneous, in world coordinate frame).

#### Proof.

1. Consider spatial line AB (B is given). We can write

$$\underline{\mathbf{X}}(\lambda) \simeq \lambda \, \underline{\mathbf{A}} + (1 - \lambda) \, \underline{\mathbf{B}}, \qquad \lambda \in \mathbb{R}$$

2. it projects to

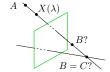

- $\mathbf{P}\underline{\mathbf{X}}(\lambda) \simeq \lambda \, \mathbf{P} \, \underline{\mathbf{A}} + (1-\lambda) \, \mathbf{P} \, \underline{\mathbf{B}} \simeq \mathbf{P} \, \underline{\mathbf{A}}$
- the entire line projects to a single point  $\Rightarrow$  it must pass through the optical center of  ${f P}$
- this holds for all choices of  $A \Rightarrow$  the only common point of the lines is the C, i.e.  $\mathbf{\underline{B}} \simeq \mathbf{\underline{C}}$

Hence

$$\mathbf{0} = \mathbf{P} \underline{\mathbf{C}} = \begin{bmatrix} \mathbf{Q} & \mathbf{q} \end{bmatrix} \begin{bmatrix} \mathbf{C} \\ 1 \end{bmatrix} = \mathbf{Q} \mathbf{C} + \mathbf{q} \implies \mathbf{C} = -\mathbf{Q}^{-1} \mathbf{q}$$

 $\underline{\mathbf{C}} = (c_j)$ , where  $c_j = (-1)^j \det \mathbf{P}^{(j)}$ , in which  $\mathbf{P}^{(j)}$  is  $\mathbf{P}$  with column j dropped Matlab: C\_homo = null(P); or C = -Q\q;

3D Computer Vision: II. Perspective Camera (p. 34/189) つへや

rank 3 but 4 columns

# ► Optical Ray

Optical ray: Spatial line that projects to a single image point.

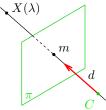

1. consider line

 $\mathbf{d}$  unit line direction vector,  $\|\mathbf{d}\|=1,\,\lambda\in\mathbb{R},$  Cartesian representation

 $\mathbf{X}(\lambda) = \mathbf{C} + \lambda \, \mathbf{d}$ 

2. the projection of the (finite) point  $X(\lambda)$  is

$$\begin{split} \underline{\mathbf{m}} &\simeq \begin{bmatrix} \mathbf{Q} & \mathbf{q} \end{bmatrix} \begin{bmatrix} \mathbf{X}(\lambda) \\ 1 \end{bmatrix} = \mathbf{Q}(\mathbf{C} + \lambda \mathbf{d}) + \mathbf{q} = \lambda \mathbf{Q} \mathbf{d} = \\ &= \lambda \begin{bmatrix} \mathbf{Q} & \mathbf{q} \end{bmatrix} \begin{bmatrix} \mathbf{d} \\ 0 \end{bmatrix} \end{split}$$

 $\ldots$  which is also the image of a point at infinity in  $\mathbb{P}^3$ 

optical ray line corresponding to image point m is the set

$$\mathbf{X}(\lambda) = \mathbf{C} + (\lambda \mathbf{Q})^{-1} \underline{\mathbf{m}}, \qquad \lambda \in \mathbb{R}$$

- ullet optical ray direction may be represented by a point at infinity  $({f d},0)$  in  ${\mathbb P}^3$
- in world coordinate frame

# ► Optical Axis

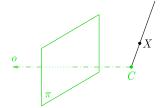

Optical axis: Optical ray that is perpendicular to image plane  $\pi$ 

**1**. points on a line parallel to  $\pi$  project to line at infinity in  $\pi$ :

$$\begin{bmatrix} u \\ v \\ 0 \end{bmatrix} \simeq \mathbf{P}\underline{\mathbf{X}} = \begin{bmatrix} \mathbf{q}_1^\top & q_{14} \\ \mathbf{q}_2^\top & q_{24} \\ \mathbf{q}_3^\top & q_{34} \end{bmatrix} \begin{bmatrix} \mathbf{X} \\ 1 \end{bmatrix}$$

2. therefore the set of points X is parallel to  $\pi$  iff

$$\mathbf{q}_3^\top \mathbf{X} + q_{34} = 0$$

- 3. this is a plane with  $\pm \mathbf{q}_3$  as the normal vector
- 4. optical axis direction: substitution  $\mathbf{P}\mapsto\lambda\mathbf{P}$  must not change the direction
- 5. we select (assuming  $det(\mathbf{R}) > 0$ )

$$\mathbf{o} = \det(\mathbf{Q}) \, \mathbf{q}_3$$

 $\text{if } \mathbf{P} \mapsto \lambda \mathbf{P} \ \text{ then } \det(\mathbf{Q}) \mapsto \lambda^3 \det(\mathbf{Q}) \ \text{ and } \ \mathbf{q}_3 \mapsto \lambda \, \mathbf{q}_3$ 

[H&Z, p. 161]

the axis is expressed in world coordinate frame

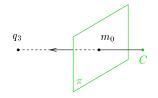

# ► Principal Point

Principal point: The intersection of image plane and the optical axis

- 1. as we saw,  $\mathbf{q}_3$  is the directional vector of optical axis
- 2. we take point at infinity on the optical axis that must project to principal point  $m_0$

3. then

$$\underline{\mathbf{m}}_0 \simeq \begin{bmatrix} \mathbf{Q} & \mathbf{q} \end{bmatrix} \begin{bmatrix} \mathbf{q}_3 \\ 0 \end{bmatrix} = \mathbf{Q} \, \mathbf{q}_3$$

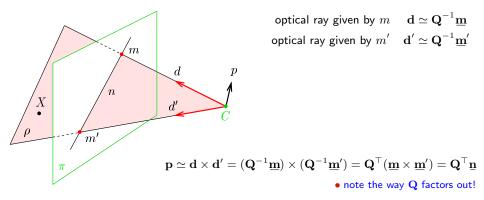

principal point:  $\mathbf{\underline{m}}_0 \simeq \mathbf{Q} \, \mathbf{q}_3$ 

principal point is also the center of radial distortion

### ► Optical Plane

A spatial plane with normal p passing through optical center C and a given image line n.

hence, 
$$0 = \mathbf{p}^{\top}(\mathbf{X} - \mathbf{C}) = \underline{\mathbf{n}}^{\top} \underbrace{\mathbf{Q}(\mathbf{X} - \mathbf{C})}_{\to 30} = \underline{\mathbf{n}}^{\top} \mathbf{P} \underline{\mathbf{X}} = (\mathbf{P}^{\top} \underline{\mathbf{n}})^{\top} \underline{\mathbf{X}}$$
 for every X in plane  $\rho$ 

optical plane is given by n:

 $\boldsymbol{\rho} \simeq \mathbf{P}^\top \mathbf{n}$ 

 $\rho_1 x + \rho_2 y + \rho_3 z + \rho_4 = 0$ 

### Cross-Check: Optical Ray as Optical Plane Intersection

p' $\overline{p}$ d mn'n $\pi$  $\mathbf{p} = \mathbf{Q}^{\top} \mathbf{n}$ optical plane normal given by n $\mathbf{p}' = \mathbf{Q}^{\top} \mathbf{n}'$ optical plane normal given by n' $\mathbf{d} = \mathbf{p} \times \mathbf{p}' = (\mathbf{Q}^{\top} \mathbf{n}) \times (\mathbf{Q}^{\top} \mathbf{n}') = \mathbf{Q}^{-1} (\mathbf{n} \times \mathbf{n}') = \mathbf{Q}^{-1} \mathbf{m}$ 

# Summary: Optical Center, Ray, Axis, Plane

General finite camera

$$\begin{split} \mathbf{P} &= \begin{bmatrix} \mathbf{Q} & \mathbf{q} \end{bmatrix} = \begin{bmatrix} \mathbf{q}_{1}^{\top} & q_{14} \\ \mathbf{q}_{2}^{\top} & q_{24} \\ \mathbf{q}_{3}^{\top} & q_{34} \end{bmatrix} = \mathbf{K} \begin{bmatrix} \mathbf{R} & \mathbf{t} \end{bmatrix} = \mathbf{K} \mathbf{R} \begin{bmatrix} \mathbf{I} & -\mathbf{C} \end{bmatrix} \\ \\ \mathbf{C} &\simeq \mathrm{rnull}(\mathbf{P}) & \text{optical center (world coords.)} \\ \mathbf{d} &= \mathbf{Q}^{-1} \underbrace{\mathbf{m}} & \text{optical ray direction (world coords.)} \\ \\ \mathrm{det}(\mathbf{Q}) \mathbf{q}_{3} & \mathrm{outward optical axis (world coords.)} \\ \\ \mathbf{Q} \mathbf{q}_{3} & \mathrm{principal point (in image plane)} \\ \\ \boldsymbol{\rho} &= \mathbf{P}^{\top} \underbrace{\mathbf{n}} & \mathrm{optical plane (world coords.)} \\ \\ \mathbf{K} &= \begin{bmatrix} f & -f \cot \theta & u_{0} \\ 0 & f / (a \sin \theta) & v_{0} \\ 0 & 0 & 1 \end{bmatrix} & \mathrm{camera (calibration) matrix } (f, u_{0}, v_{0} \text{ in pixels}) \\ \\ \\ \mathbf{R} & \mathrm{camera rotation matrix (cam coords.)} \\ \\ \\ \mathbf{t} & \mathrm{camera translation vector (cam coords.)} \end{split}$$

Thank You
