# Multi-objective Optimization

# Multi-objective Optimization

Many real-world problems involve multiple objectives.

## ■ Conflicting objectives

- A solution that is extreme with respect to one objective requires a compromise in other objectives.
- A sacrifice in one objective is related to the gain in other objective(s).

## ■ Illustrative example: Buying a car

- two extreme hypothetical cars 1 and 2,
- cars with a trade-off between cost and comfort – A, B, and C.

©Kalyanmoy Deb: Multi-Objective Optimization using Evolutionary Algorithms.

# Multi-objective Optimization

Many real-world problems involve multiple objectives.

## ■ Conflicting objectives

- A solution that is extreme with respect to one objective requires a compromise in other objectives.
- A sacrifice in one objective is related to the gain in other objective(s).

## ■ Illustrative example: Buying a car

- two extreme hypothetical cars 1 and 2,
- cars with a trade-off between cost and comfort – A, B, and C.

©Kalyanmoy Deb: Multi-Objective Optimization using Evolutionary Algorithms.

**Which solution** out of all of the trade-off solutions **is the best** with respect to all objectives?

- Without any further information those trade-offs are indistinguishable.
- **A number of optimal solutions is sought in multiobjective optimization!**

# Multi-Objective Optimization: Definition

## General form of multi-objective optimization problem

$$\begin{array}{ll} \text{Minimize/maximize} & f_m(x), \quad m = 1, 2, \dots, M; \\ \text{subject to} & g_j(x) \geq 0, \quad j = 1, 2, \dots, J; \\ & h_k(x) = 0, \quad k = 1, 2, \dots, K; \\ & x_i^{(L)} \leq x_i \leq x_i^{(U)}, \quad i = 1, 2, \dots, n. \end{array}$$

- $x$  is a vector of  $n$  decision variables:  $x = (x_1, x_2, \dots, x_n)$ .
- **Decision space** is constituted by variable bounds that restrict the value of each variable  $x_i$  to take a value within a lower  $x_i^{(L)}$  and an upper  $x_i^{(U)}$  bound.
- Inequality and equality constraints  $g_j$  and  $h_k$ .
- A solution  $x$  that satisfies all constraints and variable bounds is a **feasible solution**, otherwise it is called an **infeasible solution**.
- **Feasible space** is a set of all feasible solutions.
- Objective functions  $f(x) = (f_1(x), f_2(x), \dots, f_M(x))$  constitute a multi-dimensional **objective space**.

## Summary

©Kalyanmoy Deb: Multi-Objective Optimization using Evolutionary Algorithms.

- For each solution  $x$  in the decision space, there exists a point in the objective space

$$f(x) = z = (z_1, z_2, \dots, z_M)^T$$

# Motivation Example: Cantilever Design Problem

**Task:** design a beam, defined by two *decision variables*,

- diameter  $d$  and
- length  $l$ ,

that can carry an end load  $P$  and is optimal with respect to *objectives*

- $f_1$ : cantilever weight (to be minimized),
- $f_2$ : endpoint deflection (to be minimized),

subject to the *constraints* that

- the developed maximum stress  $\sigma_{max}$  is less than the allowable stress  $S$ ,
- the end deflection  $\delta$  is smaller than a specified limit  $\delta_{max}$ .

# Cantilever Design Problem: Decision and Objective Space

©Kalyanmoy Deb: Multi-Objective Optimization using Evolutionary Algorithms.

# Non-Conflicting Objectives

Existence of multiple trade-off solutions:

- Only if the objectives are in conflict with each other.
- If this does not hold then the cardinality of the Pareto-optimal set is one. (The optimum solutions w.r.t. individual objectives are the same.)

Example: Cantilever beam design problem:

- $f_1$ : the end deflection  $\delta$  (to be minimized),
- $f_2$ : the maximum developed stress in the beam  $\sigma_{max}$  (to be minimized).

## Performance Measures

## Summary

©Kalyanmoy Deb: Multi-Objective Optimization using Evolutionary Algorithms.

**Dominance:** A solution  $x^{(1)}$  is said to dominate another solution  $x^{(2)}$ ,  $x^{(1)} \preceq x^{(2)}$ , if  $x^{(1)}$  is not worse than  $x^{(2)}$  in all objectives and  $x^{(1)}$  is strictly better than  $x^{(2)}$  in at least one objective.

Solutions A, B, C, D are *non-dominated* solutions (Pareto-optimal solutions)

Solution E is *dominated* by C and B (E is non-optimal).

# Properties of Dominance-Based Multi-Objective Optimization

**Non-dominated set:** Among a set of solutions  $P$ , the non-dominated set of solutions  $P'$  are those that are not dominated by any member of the set  $P$ .

**Globally Pareto-optimal set** is the non-dominated set of the entire feasible space.

## Performance Measures

## Summary

©Kalyanmoy Deb: Multi-Objective Optimization using Evolutionary Algorithms.

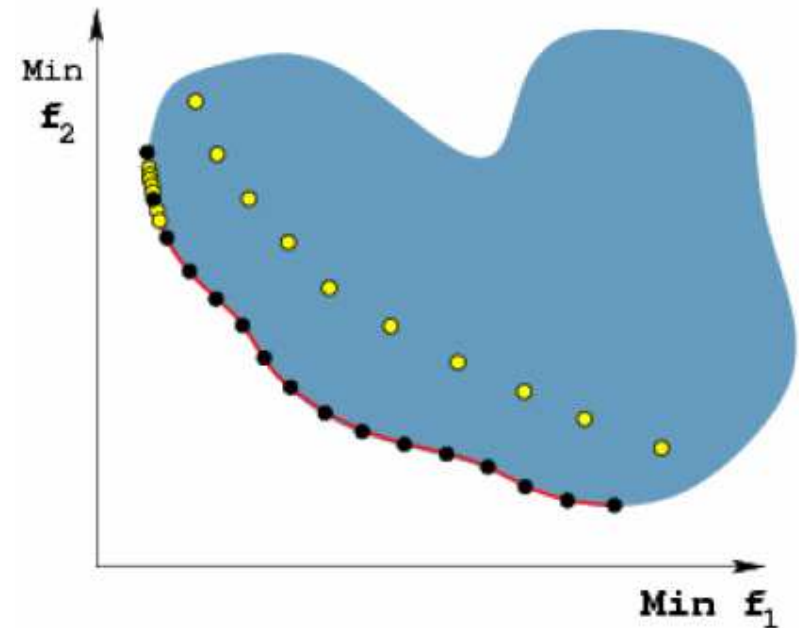

# Goals of Dominance-Based Multi-Objective Optimization

Every finite set of solutions  $P$  can be divided into two non-overlapping sets:

- **non-dominated set**  $P_1$ : contains all solutions that do not dominate each other
- **dominated set**  $P_2$ : any solution from  $P_2$  is dominated by at least one solution from  $P_1$

In the absence of other factors (e.g. preference for certain objectives, or for a particular region of the tradeoff surface) there are **two goals of multi-objective optimization**:

- **Quality**: Find a set of solutions as close as possible to the Pareto-optimal front.
- **Spread**: Find a set of non-dominated solutions as diverse as possible.

## Multi-objective Opt.

- MOO
- MOO Definition
- Dec./Obj. Space
- Example: Cantilever
- No Conflict
- Dominance
- MOO Properties
- **MOO Goals**
- Weighted Sum
- $\epsilon$ -Constraint
- Difficulties

## Multi-objective EAs

## Performance Measures

## Summary

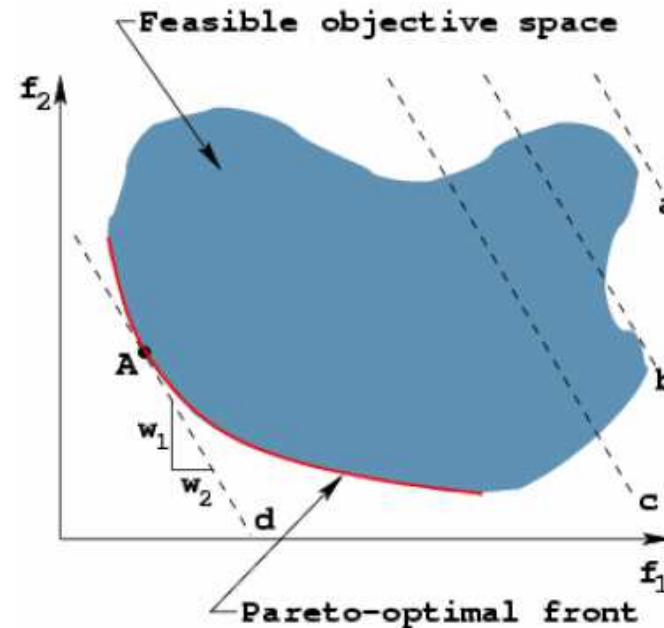

# Classical Approaches: Weighted Sum Method

- Construct a weighted sum of objectives and optimize

$$F(x) = \sum_{i=1}^m w_i \cdot f_i(x).$$

- User supplies weight vector  $w$ .
- Selection of weights  $w$  defines the slope of the line, which in turn determines the particular solution(s) on the boundary of the feasible space.

## Multi-objective Opt.

- MOO
- MOO Definition
- Dec./Obj. Space
- Example: Cantilever
- No Conflict
- Dominance
- MOO Properties
- MOO Goals
- **Weighted Sum**
- $\epsilon$ -Constraint
- Difficulties

## Multi-objective EAs

## Performance Measures

## Summary

# Difficulties with Weighted Sum Method

- Need to know weight vector  $w$ .
- To find a set of trade-off solutions, the method must be run many times with varying  $w$ .
- Non-uniformity in Pareto-optimal solutions.
- Inability to find some Pareto-optimal solutions (in non-convex region).
- However, a solution of this approach is always Pareto-optimal.

## Multi-objective Opt.

## Multi-objective EAs

## Performance Measures

## Summary

# Classical Approaches: $\varepsilon$ -Constraint Method

**Method:** Minimize a primary objective while expressing all the other objectives in the form of inequality constraints

## Multi-objective Opt.

- MOO
- MOO Definition
- Dec./Obj. Space
- Example: Cantilever
- No Conflict
- Dominance
- MOO Properties
- MOO Goals
- Weighted Sum
- $\varepsilon$ -Constraint
- Difficulties

## Multi-objective EAs

## Performance Measures

## Summary

$$\text{minimize } f_p(x)$$

$$\text{subject to } f_i(x) \leq \varepsilon_i, \text{ for } i = 1, \dots, m, i \neq p.$$

Example:

$$\text{minimize } f_2(x)$$

$$\text{subject to } f_1(x) \leq \varepsilon_1.$$

Remarks:

- To find a whole set of trade-off solutions, the method must be run many times.
- Need to know relevant  $\varepsilon$  vectors to ensure a feasible solution.
- Non-uniformity in Pareto-optimal solutions.
- However, any Pareto-optimal solution can be found with this method.

# Difficulties with Most Classical Approaches

---

- Need to run a single-objective optimizer many times.
- A lot of problem knowledge is required.
- Even then, good distribution of solutions is not guaranteed.
- Multi-objective optimization as an application of single-objective optimization.

## Multi-objective Opt.

- Dominance
- MOO Properties
- MOO Goals
- Weighted Sum
- $\epsilon$ -Constraint
- **Difficulties**

## Multi-objective EAs

## Performance Measures

## Summary

# Multi-objective EAs

# Why and How Use EAs for Multi-Objective Optimization?

---

## Why?

- *Population approach* suits well to find multiple solutions.
- *Niche-preservation methods* can be exploited to find diverse solutions.
- *Implicit parallelism* helps provide a parallel search.  
Multiple applications of classical methods do not constitute a parallel search.

## How?

- Modify the *fitness computation*.
- Emphasize non-dominated solutions for *convergence*.
- Emphasize unique solutions for *diversity*.

# Non-Dominated Sorting Genetic Algorithm (NSGA)

---

Common features with the standard GA:

- variation operators – crossover and mutation,
- selection method – Stochastic Remainder Roulette-Wheel,
- standard generational evolutionary model.

Differences of NSGA from SGA:

- fitness assignment scheme which *prefers non-dominated solutions*, and
- fitness sharing strategy which *preserves diversity among solutions of each non-dominated front*.

NSGA steps:

1. Initialize population of solutions.
2. Repeat
  - Calculate objective values and assign fitness values.
  - Generate new population.

Until stopping condition is fulfilled.

Performance Measures

Summary

**Idea:** decrease fitness of similar solutions

**Algorithm** to calculate the shared fitness value of  $i$ -th individual in population of size  $N$

1. Calculate the distances  $d_{ij}$  of individual  $i$  to all individuals  $j$ .
2. Calculate values of *sharing function* between individual  $i$  and all individuals  $j$ :

$$Sh(d_{ij}) = \begin{cases} 1 - \left(\frac{d_{ij}}{\sigma_{share}}\right)^\alpha, & \text{if } d_{ij} \leq \sigma_{share}, \\ 0, & \text{otherwise.} \end{cases}$$

3. Calculate *niche count*  $nc_i$  of individual  $i$ :

$$nc_i = \sum_{j=1}^N Sh(d_{ij})$$

4. Calculate *shared fitness* of individual  $i$ :

$$f'_i = f_i / nc_i$$

**Remark:** If  $d = 0$ , then  $Sh(d) = 1$ , meaning that two solutions are identical. If  $d \geq \sigma_{share}$ , then  $Sh(d) = 0$  meaning that two solutions do not have any sharing effect on each other.

# Fitness Sharing: Example

Bimodal function, six solutions, and corresponding shared fitness values.

- $\sigma_{share} = 0.5, \alpha = 1.$

Sol. i	String	Decoded value	$x^{(i)}$	$f_i$	$nc_i$	$f'_i$
1	110100	52	1.651	0.890	2.856	0.312
2	101100	44	1.397	0.948	3.160	0.300
3	011101	29	0.921	0.246	1.048	0.235
4	001011	11	0.349	0.890	1.000	0.890
5	110000	48	1.524	0.997	3.364	0.296
6	101110	46	1.460	0.992	3.364	0.295

©Kalyanmoy Deb: Multi-Objective Optimization using Evolutionary Algorithms.

Let's take the first solution:

- $d_{11} = 0.0, d_{12} = 0.254, d_{13} = 0.731, d_{14} = 1.302, d_{15} = 0.127, d_{16} = 0.191$
- $Sh(d_{11}) = 1, Sh(d_{12}) = 0.492, Sh(d_{13}) = 0, Sh(d_{14}) = 0, Sh(d_{15}) = 0.746, Sh(d_{16}) = 0.618.$
- $nc_1 = 1 + 0.492 + 0 + 0 + 0.746 + 0.618 = 2.856$
- $f'(1) = f(1)/nc_1 = 0.890/2.856 = 0.312$

**Remark:**

- The above example computes  $d_{ij}$  in decision space,  $d_{ij} = d(x_i - x_j).$
- To create diverse set of non-dominated solutions, we have to compute it in the objective space, e.g.,  $d_{ij} = d(f(x_i) - f(x_j)) = d(z_i - z_j)$  (or see next slide).

Performance Measures

Summary

1. Choose sharing parameter  $\sigma_{share}$ , small positive number  $\epsilon$ , initialize  $f_{max} = PopSize$  and front counter  $front = 1$
2. Find set  $P' \subset P$  of non-dominated solutions.
3. For each  $q \in P'$ ,
  - assign fitness  $f(q) = f_{max}$ ,
  - calculate sharing function with all solutions in  $P'$ , niche count  $nc_q$  among solutions of  $P'$  only, the normalized Euclidean distance  $d_{ij}$  is calculated as

$$d_{ij} = \sqrt{\sum_{m=1}^M \left( \frac{f_m^{(i)} - f_m^{(j)}}{f_m^{max} - f_m^{min}} \right)^2},$$

- calculate shared fitness  $f'(q) = f(q) / nc_q$ .
4.  $f_{max} = \min(f'(q) : q \in P') - \epsilon$ ,  
 $P = P \setminus P'$ ,  
 $front = front + 1$ .
  5. If not all solutions are assessed go to step 2, otherwise stop.

# NSGA: Fitness Assignment (cont.)

Example:

- First, 6 solutions are classified into different non-dominated fronts.
- Then, the fitness values are calculated according to the fitness sharing method.
  - The sharing function method is used front-wise.
  - Within a front, less dense solutions have better fitness values.

Summary

# NSGA: Conclusions

## Computational complexity

- Governed by the non-dominated sorting procedure and the sharing function implementation.
  - **non-dominated sorting** – complexity of  $O(MN^3)$ .
  - **sharing function** – requires every solution in a front to be compared with every other solution in the same front, total of  $\sum_{j=1}^{\rho} |P_j|^2$ , where  $\rho$  is a number of fronts. Each distance computation requires evaluation of  $n$  differences between parameter values. In the worst case, when  $\rho = 1$ , the overall complexity is of  $O(nN^2)$ .

## Advantages:

- Assignment of fitness according to non-dominated sets makes the algorithm converge towards the Pareto-optimal region.
- Sharing allows phenotypically diverse solutions to emerge.

## Disadvantages:

- non-elitist
- sensitive to the sharing method parameter  $\sigma_{share}$ 
  - requires some guidelines for setting the  $\sigma_{share}$
  - e.g.,  $\sigma_{share} = \frac{0.5}{\sqrt{n/q}}$  based on the expected number of optima  $q$

Performance Measures

Summary

# NSGA-II: Diversity preservation

Density estimation: **crowding distance** estimates how much unique the solution is.

- For individual  $i$ , find its predecessor and successor in each objective.
- Crowding distance  $i^{distance}$  is the sum of differences in objective values of predecessor and successor across all objectives.
- For individuals with extreme value of at least one objective,  $i^{distance} = \infty$ .

©Kalyanmoy Deb: Multi-Objective Optimization using Evolutionary Algorithms.

## Crowded comparison operator $\prec_c$ :

- Every solution in the population has two attributes:
  1. non-domination rank  $i^{rank}$ , and
  2. crowding distance  $i^{distance}$
- A partial order  $\prec_c$  is defined as:

$$i \prec_c j \quad \text{if} \quad i^{rank} < j^{rank} \quad \text{or} \quad (i^{rank} = j^{rank} \quad \text{and} \quad i^{distance} > j^{distance}).$$

# NSGA-II: Constraint Handling Approach

---

**Binary tournament selection** with modified domination concept is used to choose the better solution out of the two solutions  $i$  and  $j$ , randomly picked up from the population.

In the presence of constraints, each solution in the population can be either **feasible** or **infeasible**, so that there are the following three possible situations:

1. both solutions are feasible,
2. one is feasible and other is not,
3. both are infeasible.

**Binary tournament selection** with modified domination concept is used to choose the better solution out of the two solutions  $i$  and  $j$ , randomly picked up from the population.

In the presence of constraints, each solution in the population can be either **feasible** or **infeasible**, so that there are the following three possible situations:

1. both solutions are feasible,
2. one is feasible and other is not,
3. both are infeasible.

**Constrained-domination:** A solution  $i$  is said to constrained-dominate a solution  $j$ , if any of the following conditions is true:

1. Solution  $i$  is feasible and solution  $j$  is not.
2. Solutions  $i$  and  $j$  are both infeasible, but solution  $i$  has a smaller overall constraint violation.
3. Solutions  $i$  and  $j$  are feasible, and solution  $i$  dominates solution  $j$ .

# NSGA-II: Bi-objective Symbolic Regression

Optimization objectives:

- Minimize MSE on the training data set.
- Minimize deviation of the symbolic models from the desired properties.

Desired properties:

- Monotonically increasing in the intervals  $y = \langle -0.075, -0.01 \rangle$  and  $y = \langle 0.01, 0.075 \rangle$
- Monotonically decreasing in the interval  $y = \langle -0.07, 0.07 \rangle$
- $F(y) \geq 0$ , for  $y \in \langle -0.075, 0.0 \rangle$
- $F(y) \leq 0$ , for  $y \in \langle 0.0, 0.075 \rangle$
- $|F(0.0)| < 0.005$
- $|F(-0.075) - 0.001| < 0.0005$
- $|F(0.075) + 0.001| < 0.0005$

# Strength Pareto Evolutionary Algorithm 2 (SPEA2)

---

SPEA2 maintains two sets of solutions:

- **regular population** of newly generated solutions, and
- **archive**, which contains a representation of the nondominated front among all solutions considered so far.

Archive:

- **The archive size is fixed**, i.e., whenever the number of nondominated individuals is less than the predefined archive size, the archive is filled up by *good* dominated individuals.
- A **truncation method** is invoked when the nondominated front exceeds the archive limit.
- A member of the archive is only removed if
  1. a solution has been found that dominates it, or
  2. the maximum archive size is exceeded and the portion of the front where the archive member is located is overcrowded.
- The archive makes it possible not to lose certain portions of the current nondominated front due to random effects.
- **All individuals in the archive participate in selection.**

Summary

---

# SPEA2: Algorithm

---

Input:  $N$  is the population size,  $\bar{N}$  is the archive size.

1. **Initialization:** Generate an initial population  $P_0$  and create the empty archive  $\bar{P}_0 = \emptyset$ . Set  $t = 0$ .
2. **Fitness assignment:** Calculate fitness of individuals in  $P_t$  and  $\bar{P}_t$ .
3. **Environmental selection:** Copy all nondominated individuals in  $P_t$  and  $\bar{P}_t$  to  $\bar{P}_{t+1}$ .
  - If size of  $\bar{P}_{t+1}$  exceeds  $\bar{N}$  then reduce  $\bar{P}_{t+1}$  using the truncation operator.
  - If size of  $\bar{P}_{t+1}$  is less than  $\bar{N}$  then fill  $\bar{P}_{t+1}$  with dominated solutions in  $P_t$  and  $\bar{P}_t$ .
4. **Termination:** If  $t \geq T$  then return nondominated solutions in  $\bar{P}_{t+1}$ . Stop.
5. **Mating selection:** Perform binary tournament selection with replacement on  $\bar{P}_{t+1}$  in order to fill the mating pool.
6. **Variation:** Apply recombination and mutation operators to the mating pool and fill  $P_{t+1}$  with the generated solutions.
7. Increment generation counter  $t = t + 1$ .
8. Go to Step 2.

Performance Measures

Summary

Fitness assignment (fitness should be minimized):

- For each individual, both dominating and dominated solutions are taken into account.
- Each individual  $i$  in the archive  $\bar{P}_t$  and in the population  $P_t$  is assigned a **strength value**  $S(i)$ , representing the number of solutions it dominates.
- The raw fitness  $R(i)$  of an individual  $i$  is calculated as

$$R(i) = \sum_{j \in P_t + \bar{P}_t, j \succ i} S(j),$$

i.e.,  $R(i)$  is determined by the strengths of its dominators in both archive and population.  $R(i) = 0$  corresponds to a nondominated solution.

- Since the **raw fitness assignment** is based on the concept of Pareto dominance, it **may fail when most individuals do not dominate each other.**

Both objectives should be maximized.

# SPEA2: Density Estimation

**Density information** is incorporated to discriminate between individuals having identical raw fitness values.

The density at any point is estimated as a (decreasing) function of the distance to the  $k$ -th nearest data point – calculated as the inverse of the distance to the  $k$ -th nearest neighbor.

- $k$  equal to the square root of the sample size is used:  $k = \sqrt{N + \bar{N}}$ .
- **Density**  $D(i)$  is calculated as

$$D(i) = \frac{1}{\sigma_i^k + 2}$$

where  $\sigma_i^k$  is the distance to the  $k$ -th nearest neighbor and it is made sure that  $D(i) < 1$ .

**Final fitness** is given as

$$F(i) = R(i) + D(i).$$

Performance Measures

Summary

# SPEA2: Environmental Selection

After copying all nondominated individuals from archive and population to the archive of the next generation,

- if the archive is too small (i.e.  $|\bar{P}_{t+1}| < \bar{N}|$ ), the best  $\bar{N} - |\bar{P}_{t+1}|$  dominated solutions (w.r.t. fitness) in the previous archive and population are copied to the new archive;
- if the archive is too large (i.e.  $|\bar{P}_{t+1}| > \bar{N}|$ ), individuals from  $\bar{P}_{t+1}$  are iteratively removed until  $|\bar{P}_{t+1}| = \bar{N}$ .

At each iteration, the individual which has the minimum distance to another individual is chosen (a tie is broken by considering the second smallest distances and so forth).

Performance Measures

Summary

# SPEA2: Conclusions

---

## SPEA2

- uses the concept of **Pareto dominance** in order to assign scalar fitness values to individuals;
- uses a **fine-grained fitness** assignment strategy which **incorporates density information** in order to distinguish between solutions that are indifferent, i.e., do not dominate each other;
- uses environmental selection in order to keep the optimal diversity in the archive;
- seems to have advantages over NSGA-II in higher dimensional objective spaces.

### Performance Measures

---

### Summary

---

# Measuring MO Performance

# MOEA Performance Measures

---

The result of a MOEA run is not a single scalar value, but a collection of vectors forming a non-dominated set.

- Comparing two MOEA algorithms requires comparing the non-dominated sets they produce.
- However, there is no straightforward way to compare different non-dominated sets.

## Three goals that can be identified and measured:

1. The distance of the resulting non-dominated front to the Pareto front should be minimized.
2. A good (in most cases uniform) distribution of the solutions found is desirable.
3. The extent of the obtained non-dominated front should be maximized, i.e., for each objective, a wide range of values should be present.

Multi-objective Opt.

Multi-objective EAs

Performance Measures

• MOEA Performance

• S Metric

• C Metric

Summary

# S Metric

**Size of the space covered**  $S(X)$ : it calculates the *hypervolume* of the multi-dimensional region enclosed by a set  $A$  and a *reference point*  $Z^{ref}$ . The hypervolume expresses the size of the region that is dominated by  $A$ .

So, the bigger the value of this measure the better the quality of  $A$  is, and vice versa.

Multi-objective Opt.

Multi-objective EAs

Performance Measures

- MOEA Performance
- S Metric
- C Metric

Summary

© Knowles J. and Corne D.: On Metrics for Comparing Non-Dominated Sets.

## S Metric (cont.)

---

### Pros:

- Given two non-dominated sets,  $A$  and  $B$ , if each point in  $B$  is dominated by a point in  $A$  then  $A$  will always be evaluated as being better than  $B$ .
- Independence: the hypervolume calculated for the given set is not dependent on any other, or any reference set.
- Differentiates between different degrees of complete outperformance of two sets.
- Intuitive meaning/interpretation.

### Cons:

- Requires defining some upper boundary of the region. This choice does affect the ordering of non-dominated sets.
- It has a large computational overhead,  $O(n^{k+1})$ , where  $n$  is the number of nondominated solutions and  $k$  is the number of objectives, rendering it unusable for many objectives or large sets.
- It multiplies apples by oranges, i.e., different objectives together.

Multi-objective Opt.

Multi-objective EAs

Performance Measures

- MOEA Performance
- S Metric
- C Metric

Summary

## C Metric

**Coverage of two sets**  $C(X, Y)$ : given two sets of non-dominated solutions  $X$  and  $Y$  found by the compared algorithms, the measure  $C(X, Y)$  returns a ratio of a number of solutions of  $Y$  that are dominated by or equal to any solution of  $X$  to the whole set  $Y$ .

Multi-objective Opt.

Multi-objective EAs

Performance Measures

- MOEA Performance
- S Metric
- C Metric

Summary

- It returns values from the interval  $[0, 1]$ .
- The value  $C(X, Y) = 1$  means that all solutions in  $Y$  are covered by solutions of the set  $X$ . And vice versa, the value  $C(X, Y) = 0$  means that none of the solutions in  $Y$  are covered by the set  $X$ .
- Always both orderings have to be considered, since  $C(X, Y)$  is not necessarily equal to  $1 - C(Y, X)$ .

$$C(A, B) = 0.25, C(B, A) = 0.75$$

Properties:

- It has low computational overhead.
- If two sets are of different cardinality and/or the distributions of the sets are non-uniform, then it gives unreliable results.

## C Metric (cont.)

Properties:

- Any pair of  $C$  metric scores for a pair of sets  $A$  and  $B$  in which neither  $C(A, B) = 1$  nor  $C(B, A) = 1$ , indicates that the two sets are incomparable according to the weak outperformance relation.
- It is cycleinducing – if three sets are compared using  $C$ , they may not be ordered.

Example:

- $C(A, B) = 0, C(B, A) = 3/4$
- $C(B, C) = 0, C(C, B) = 1/2$
- $C(A, C) = 1/2, C(C, A) = 0$

$B$  considered better than  $A$ ,  $A$  better than  $C$ , but  $C$  better than  $B$ .

Summary

# Summary

# Learning outcomes

---

After this lecture, a student shall be able to

- define a multi-objective optimization problem and describe the relationship between decision and objective spaces;
- define the dominance principle and the Pareto-optimal solutions;
- identify non-dominated solutions in a set of solutions;
- list and describe two goals of multi-objective optimization;
- describe some non-evolutionary approaches to multi-objective optimization and explain their deficiencies;
- implement evolutionary multi-objective algorithms and explain their differences from ordinary EA;
- explain algorithms NSGA, NSGA-II, SPEA2 and their differences;
- implement constraint handling in NSGA-II;
- define performance measures used in multi-objective optimizations ( $S$  metric and  $C$  metric);
