Part 1 - Path Planning -

Introduction to Path Planning

■ Part 2 - Grid and Graph based Path Planning Methods

• Path Planning based on Reaction-Diffusion Process

piano from one place to another without hitting anything.

Notation and Terminology

■ Path Planning Methods

Grid-based Planning

DT for Path Planning

Graph Search Algorithms

Piano Mover's Problem

A classical motion planning problem

Having a CAD model of the piano, model of the environment, the problem is how to move the

Overview of the Lecture

Robot Motion Planning - Motivational problem

■ How to transform high-level task specification (provided by humans) into a low-level description suitable for controlling the actuators?

To develop algorithms for such a transformation.

The motion planning algorithms provide transformations how to move a robot (object) considering all operational constraints.

obstacles O_i .

the motion plan.

■ C – Configuration space (C-space)

A subset of C occupied by obstacles is

Collision-free configurations are

• Let \mathcal{A} be a subset of \mathcal{W} occupied by the robot, $\mathcal{A} = \mathcal{A}(q)$.

We need notion of model representations and formal definition of the problem.

Moreover, we also need a context about the problem and realistic assumptions.

Notation

 \blacksquare W - World model describes the robot workspace and its boundary determines the

A Robot is defined by its geometry, parameters (kinematics) and it is controllable by

A concept to describe possible configurations of the robot. The robot's configuration

completely specify the robot location in ${\mathcal W}$ including specification of all degrees of

 $C_{obs} = \{q \in C : A(q) \cap O_i, \forall i\}.$

The plans have to be admissible and feasible

Basic motion planning algorithms are focused primarily on rotations and translations

Trajectory Generation

Path / Motion Planning Problem

Sensing and Acting

 $\pi: [0,1] \to \mathcal{C}_{free}$, with $\pi(0) = q_0$, and $\pi(1) = q_f$.

 Trajectory is a path with explicit parametrization of time, e.g., accompanied by a description of the motion laws $(\gamma : [0,1] \to \mathcal{U}$, where \mathcal{U} is robot's action space).

 $[T_0, T_f] \ni t \leadsto \tau \in [0, 1] : q(t) = \pi(\tau) \in \mathcal{C}_{free}$

The path planning is the determination of the function $\pi(\cdot)$.

■ Path is a continuous mapping in C-space such that

Additional requirements can be given:

Mission Planning

Problem

Robot Control

- Smoothness of the path;
- Kinodynamic constraints, e.g., considering friction forces;
- Optimality criterion shortest vs fastest (length vs curvature).
- Path planning planning a collision-free path in C-space.
- Motion planning planning collision-free motion in the state space.

Real Mobile Robots

In a real deployment, the problem is more complex

- The world is changing.
- Robots update the knowledge about the environment.

localization, mapping and navigation

New decisions have to be made based on the feedback from the environment. Motion planning is a part of the mission re-

planning loop.

An example of robotic mission:

Multi-robot exploration of unknown environment.

How to deal with real-world complexity?

Relaxing constraints and considering realistic assumptions.

Josef Štrunc Bachelor thesis CTU 2009

 $C_{free} = C \setminus C_{obs}$.

B4M36UIR - Lecture 03: Path Planning

E.g., a robot with rigid body in a plane $C = \{x, y, \varphi\} = \mathbb{R}^2 \times S^1$.

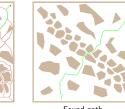

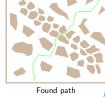

Planning in C-space Example of C_{obs} for a Robot with Rotation Representation of C-space Robot path planning for a disk-shaped robot with a radius ρ . How to deal with continuous representation of C-space? Continuous Representation of C-space Discretization processing critical geometric events, (random) sampling roadmaps, cell decomposition, potential field **Graph Search Techniques** Point robot BFS. Gradient Search. A* A simple 2D obstacle \rightarrow has a complicated C_{obs} Motion planning problem in geometrical Motion planning problem in C-space representation representation of W Deterministic algorithms exist. \mathcal{C} -space has been obtained by enlarging obstacles by the disk \mathcal{A} with the radius ρ . Requires exponential time in C dimension, J. Canny, PAMI, 8(2):200-209, 1986. By applying Minkowski sum: $\mathcal{O} \oplus \mathcal{A} = \{x+y \mid x \in \mathcal{O}, y \in \mathcal{A}\}$ B4M36UIR – Lecture 03: Path Planning Explicit representation of C_{free} is impractical to compute. B4M36UIR - Lecture 03: Path Planning Visibility Graph Planning Methods - Overview Minimal Construct: Efficent Shortest Path in Polygonal Maps 1. Compute visibility graph (selected approaches) ■ Minimal Construct algorithm computes visibility graph during the A* search instead of first computation of the 2. Find the shortest path E.g., by Dijkstra's algorithm. complete visibility graph and then finding the shortest path using A* or Dijkstra algorithm. ■ Point-to-point path/motion planning. Multi-goal path/motion/trajectory planning later Based on A* search with line intersection tests are delayed until ■ Roadmap based methods — Create a connectivity graph of the free space. they become necessary. The intersection tests are further accelerated using bounding Visibility graph Cell decomposition ■ Voronoi graph Discretization into a grid-based (or lattice-based) representation Potential field methods (complete only for a "navigation function", which is hard to compute in general) Classic path planning algorithms ■ Randomized sampling-based methods Visibility graph Found shortest path Problem Creates a roadmap from connected random samples in C_{free}. Constructions of the visibility graph: Probabilistic roadmaps. Samples are drawn from some distribution. Naïve – all segments between n vertices of the map O(n³); Very successful in practice. Using rotation trees for a set of segments – O(n²). M. H. Overmars and E. Welzl, 1988 16 / 118 B4M36UIR - Lecture 03: Path Planning Voronoi Graph Visibility Graph vs Voronoi Graph Cell Decomposition Visibility graph 1. Decompose free space into parts. Any two points in a convex region can be directly connected by a 1. Roadmap is Voronoi graph that maximizes clearance from the obstacles. 2. Start and goal positions are connected to the graph. • Shortest path, but it is close to obstacles. We have to consider safety 2. Create an adjacency graph representing the connectivity of the free space. of the path. 3. Path is found using a graph search algorithm 3. Find a path in the graph.

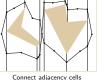

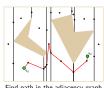

- Voronoi graph
- Small changes in obstacles can lead to large changes in the graph.
- Complicated in higher dimensions.

D. Halperin. 2004.

For higher dimensions we need other types of roadmaps. B4M36UIR - Lecture 03: Path Planning

B4M36UIR - Lecture 03: Path Planning

Other decomposition (e.g., triangulation) are possible.

An error in plan execution can lead to a

Complicated in higher dimensions

- It maximize clearance, which can provide conservative paths.

A combination is called Visibility-Voronoi - R. Wein, J. P. van den Berg,

Find path in the adjacency graph

Point Location Problem

• For a given partitioning of the polygonal domain into a discrete set of cells, determine the cell

Shortest Path Map (SPM)

lacksquare Speedup computation of the shortest path towards a particular goal location p_g for a polygonal domain \mathcal{P} with n vertices.

- A partitioning of the free space into cells with respect to the particular location p_{g}
- Each cell has a vertex on the shortest path to p_g .
- Shortest path from any point p is found by determining the cell (in $O(\log n)$ using point location alg.) and then travesing the shortest path with up to k bends, i.e., it is found in $O(\log n + k)$.
- Determining the SPM using "wavefront" propagation based on continuous Dijkstra paradigm.
 - Joseph S. B. Mitchell: A new algorithm for sh-
- SPM is a precompute structure for the given \mathcal{P} and p_g ;
 - single-point query.

There is a class of algorithms based on navigation mesh.

A supporting structure representing the free space.

It can be implemented using interval trees - slabs and slices

ACM Trans. Graph., 3(2):86-109, 1984

• Such a function is called navigation function and $-\nabla f(q)$ points to the goal. • Create a potential field that will attract robot towards the goal q_f while obstacles will generate repulsive potential repelling the robot away from the obstacles.

■ The estimation can be further improved by "ray-shooting" technique combined with walking in

Artificial Potential Field Method

• The idea is to create a function f that will provide a direction towards the goal for any

Grid-based Planning

Approximate Shortest Path and Navigation Mesh

• We can use any convex partitioning of the polygonal map to speed up shortest path queries.

1. Precompute all shortest paths from map vertices to p_g using visibility graph. 2. Then, an estimation of the shortest path from p to p_g is the shortest path among the one

for a given point p.

It usually originated from the grid based maps, but it is represented as CDT - Constrained

Navigation Mesh In addition to robotic approaches, fast shortest path queries are studied in computer games.

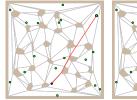

of the cell vertex.

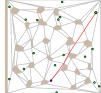

triangulation (convex partitioning).

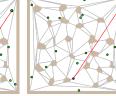

configuration of the robot.

Path Refinement

- Testing collision of the point p with particular vertices of the estimation of the shortest path.
 - Let the initial path estimation from p to p_g be a sequence of k vertices $(p, v_1, \dots, v_k, p_g)$.
 - We can iteratively test if the segment (p, v_i) , $1 < i \le k$ is collision free up to (p, p_g)

E.g., Polyanya algorithm based on navigation mesh and best-first search.

A subdivision of Cfree into smaller cells.

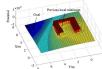

ders by a diameter of the robot.

• Grow obstacles can be simplified by growing bor-

• Construction of the planning graph G = (V, E) for

V as a set of cells and E as the neighbor-relations.

Avoiding Local Minima in Artificial Potential Field

Consider harmonic functions that have only one extremum

$$\nabla^2 f(q) = 0.$$

• Finite element method with defined Dirichlet and Neumann boundary conditions.

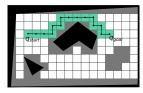

Part 2 - Grid and Graph based Path Planning Methods

Part II

4-neighbors and 8-neighbors

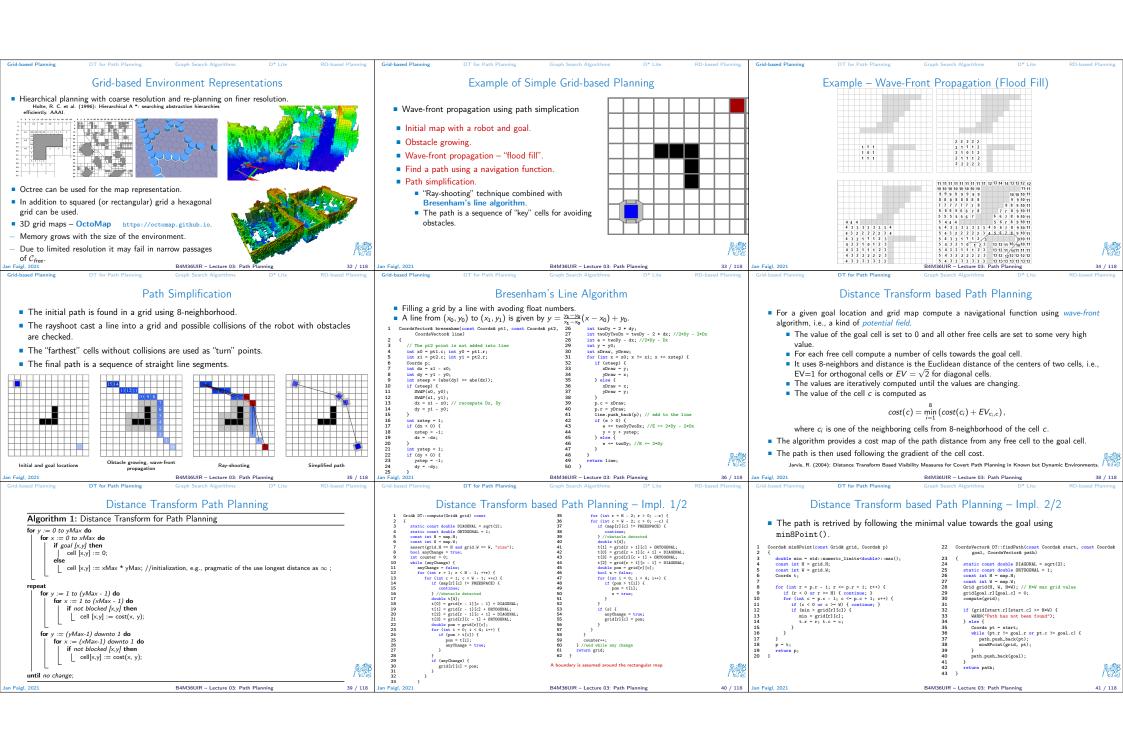

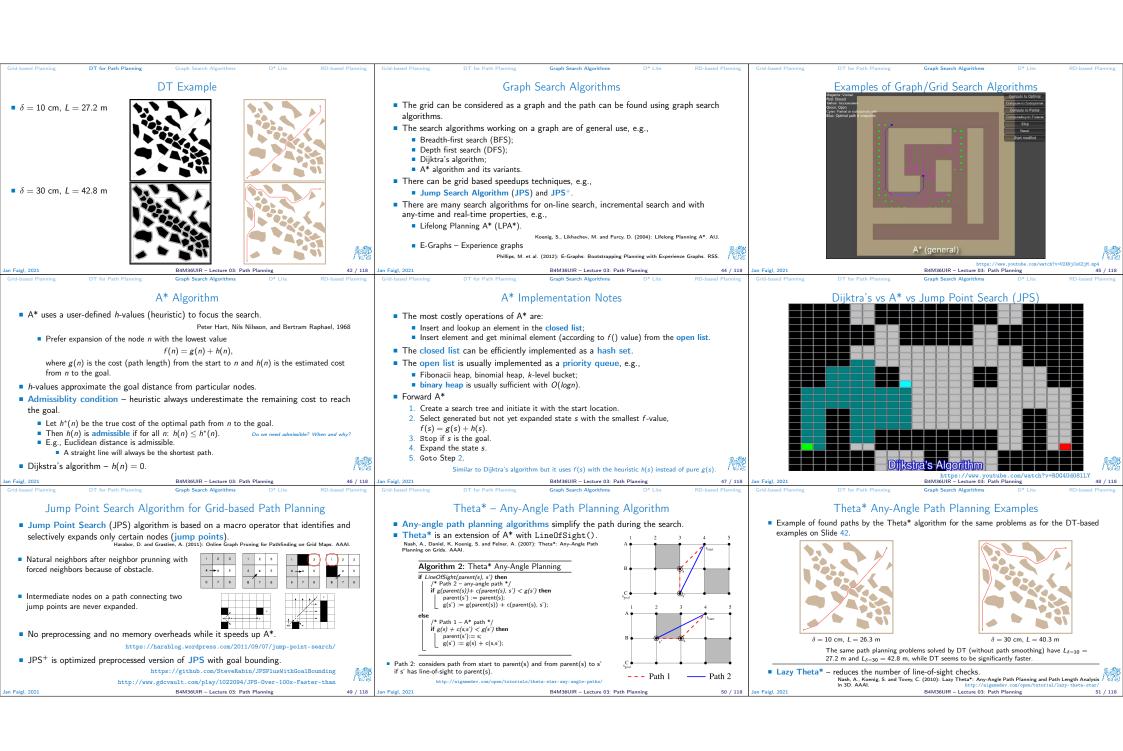

occupancy grid maps. E.g., using thresholding.

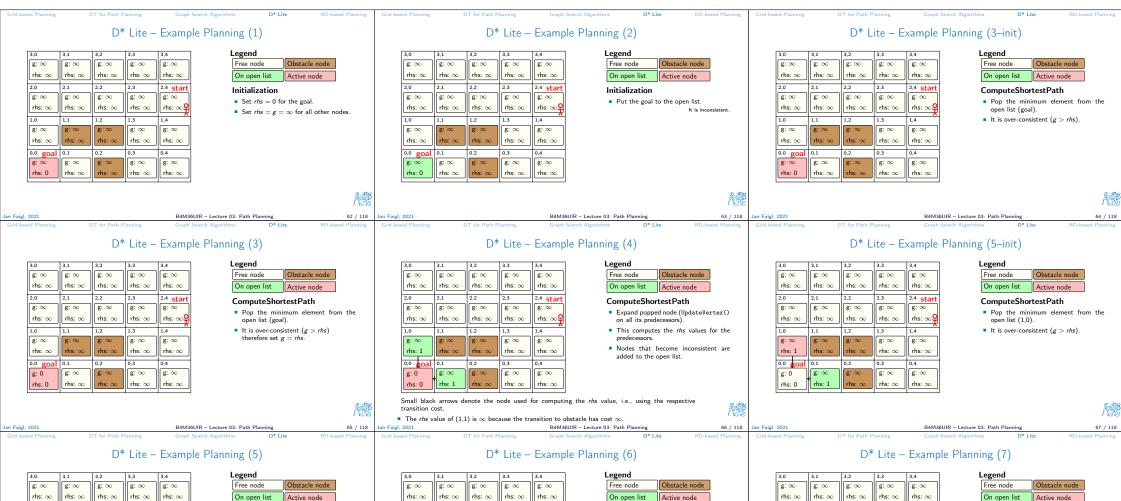

A* Variants - Online Search Real-Time Adaptive A* (RTAA*) D* Lite - Demo • The state space (map) may not be known exactly in advance. Environment can dynamically change. True travel costs are experienced during the path execution. Execute A* with limited look-ahead. while (s_{curr} ∉ GOAL) do Repeated A* searches can be computationally demanding. Learns better informed heuristic from astar(lookahead); ■ Incremental heuristic search if s' = FAILURE then the experience, initially h(s), e.g., Eu-Repeated planning of the path from the current state to the goal. return FAILURE; Planning under the free-space assumption. clidean distance. for all $s \in CLOSED$ do Reuse information from the previous searches (closed list entries). Look-ahead defines trade-off between H(s) := g(s') + h(s') - g(s);■ Focused Dynamic A* (D*) - h* is based on traversability, it has been used, e.g., for the optimality and computational cost. Mars rover "Opportunity" execute(plan); // perform one step astar(lookahead) Stentz, A. D* Lite - Example Planning (39)

Legend

Free node	Obstacle node	
On open list	Active node	

Follow the gradient of g values from the robot's current position (node).

D* Lite - Comments

- D* Lite works with real valued costs, not only with binary costs (free/obstacle).
- The search can be focused with an admissible heuristic that would be added to the g
- The final version of D* Lite includes further optimization (not shown in the example).
 - Updating the rhs value without considering all successors every time.
 - Re-focusing the search as the robot moves without reordering the entire open list.

Reaction-Diffusion Processes Background

- Reaction-Diffusion (RD) models dynamical systems capable to reproduce the au-
- Autowaves a class of nonlinear waves that propagate through an active media. At the expense of the energy stored in the medium, e.g., grass combustion.
- RD model describes spatio-temporal evolution of two state variables $u = u(\vec{x}, t)$ and $v = v(\vec{x}, t)$ in space \vec{x} and time t

$$\dot{u} = f(u, v) + D_u \triangle u
\dot{v} = g(u, v) + D_v \triangle v$$

where \triangle is the Laplacian.

This RD-based path planning is informative, just for curiosity.

RD-based Path Planning - Computational Model

 $discretization \rightarrow grid\ based\ computation \rightarrow grid\ map$

i.e., constraining concentration levels to some specific values.

107 / 118

108 / 118

■ External forcing — introducing additional information

Two-phase evolution of the underlying RD model.

Reaction-Diffusion Background

FitzHugh-Nagumo (FHN) model

FitzHugh R, Biophysical Journal (1961)

$$\dot{u} = \varepsilon \left(u - u^3 - v + \phi \right) + D_u \triangle u$$

$$\dot{v} = \left(u - \alpha v + \beta \right) + D_v \triangle u$$

where α, β, ϵ , and ϕ are parameters of the model.

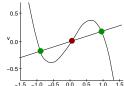

• Dynamics of RD system is determined by the associated nullcline configurations for $\dot{u}=0$ and $\dot{v}=0$ in the absence of diffusion, i.e.,

$$\varepsilon \left(u - u^3 - v + \phi \right) = 0,$$

$$\left(u - \alpha v + \beta \right) = 0.$$

which have associated geometrical shapes.

Nullcline Configurations and Steady States

- Nullclines intersections represent:
- Stable States (SSs):
- Unstable States.
- Bistable regime

The system (concentration levels of (u, v) for each grid cell)

"preference" of SS+ over SS-

- System moves from SS^- to SS^+ , if a small perturbation is intro-
- The SSs are separated by a mobile frontier a kind of traveling frontwave (autowaves).

Parallel propagation of the frontwave with non-annihilation property.

Finite difference method on a Cartesian grid with Dirichlet boundary

- Vázquez-Otero and Muñuzuri, CNNA (2010)
- Terminate when the frontwave reaches the goal.

lacktriangle Freespace is set to SS^- and the start location SS^+

2. Contraction phase

1. Propagation phase

conditions (FTCS).

- Different nullclines configuration.
- Start and goal positions are forced towards SS+
- SS⁻ shrinks until only the path linking the forced points remains

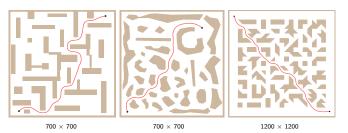

111 / 118

Distance Transform

Reaction-Diffusion

Example of Found Paths

• The path clearance maybe adjusted by the wavelength and size of the computational grid. Control of the path distance from the obstacles (path safety).

Otero A, Faigl J, Muñuzuri A Jarvis R Advanced Mobile Robots (1994)

Comparison with Standard Approaches

Voronoi Diagram

 RD-based approach provides competitive paths regarding path length and clearance, while they seem to be smooth.

Robustness to Noisy Data
