# Part 3 – Multi-goal Motion Planning (MGMP)

63 / 72

### Multi-Goal Motion Planning

Physical Orienteering Problem (POP) Multi-Goal Motion Planning Physical Orienteering Problem (POP)

### Multi-Goal Motion Planning

- In the previous cases, we consider existing roadmap or relatively "simple" collision free (shortest) paths in the polygonal domain.
- However, determination of the collision-free path in high dimensional configuration space (Cspace) can be a challenging problem itself.
- Therefore, we can generalize the MTP to multi-goal motion planning (MGMP) considering motion planners using the notion of C-space for avoiding collisions.
- An example of MGMP can be to plan a cost efficient trajectory for hexapod walking robot to visit a set of target locations.

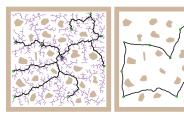

## MGMP – Existing Approches

- Determining all paths connecting any two locations  $g_i, g_i \in \mathcal{G}$  is usually very computationally demanding.
- Considering Euclidean distance as an approximation in the solution of the TSP as the Minimum Spanning Tree (MST) - Edges in the MST are iteratively refined using optimal motion planner until all edges represent a feasible solution.

# Problem Statement – MGMP Problem

- The working environment  $\mathcal{W} \subset \mathbb{R}^3$  is represented as a set of obstacles  $\mathcal{O} \subset \mathcal{W}$  and the robot configuration space C describes all possible configurations of the robot in W.
- For  $q \in C$ , the robot body  $\mathcal{A}(q)$  at q is collision free if  $\mathcal{A}(q) \cap \mathcal{O} = \emptyset$  and all collision free configurations are denoted as  $C_{free}$ .
- Set of *n* goal locations is  $\mathcal{G} = (g_1, \ldots, g_n), g_i \in \mathcal{C}_{free}$ .
- Collision free path from  $q_{start}$  to  $q_{goal}$  is  $\kappa$  :  $[0,1] \rightarrow C_{free}$  with  $\kappa(0) = q_{start}$  and  $d(\kappa(1), q_{end}) < \epsilon$ , for an admissible distance  $\epsilon$ .
- Multi-goal path  $\tau$  is admissible if  $\tau : [0,1] \to C_{free}, \tau(0) = \tau(1)$  and there are *n* points such that  $0 \le t_1 \le t_2 \le \ldots \le t_n$ ,  $d(\tau(t_i), v_i) < \epsilon$ , and  $\bigcup_{1 \le i \le n} v_i = \mathcal{G}$ .
- The problem is to find the path  $\tau^*$  for a cost function c such that  $c(\tau^*) =$  $\min\{c(\tau) \mid \tau \text{ is admissible multi-goal path}\}.$

# Multi-Goal Trajectory Planning with Limited Travel Budget Physical Orienteering Problem (POP)

- Orienteering Problem (OP) in an environment with obstacles and motion constraints of the data collecting vehicle.
- A combination of motion planning and routing problem with profits.
- VNS-PRM\* VNS-based routing and motion planning is addressed by PRM\*.
- An initial low-dense roadmap is continuously expanded during the VNS-based POP optimization to shorten paths of promising solutions.
- Shorten trajectories allow visiting more locations within T<sub>max</sub>.
