# **PUI: Notes on Classical Planning**

Daniel Fišer Danfis@danfis.cz

Department of Computer Science, Faculty of Electrical Engineering Czech Technical University in Prague

## 1. Representations

**Definition 1.** A STRIPS **planning task**  $\Pi$  is specified by a tuple  $\Pi = \langle \mathcal{F}, \mathcal{O}, s_{init}, s_{goal}, c \rangle$ , where  $\mathcal{F} = \{f_1, ..., f_n\}$  is a set of facts,  $\mathcal{O} = \{o_1, ..., o_m\}$  is a set of operators, and c is a cost function mapping each operator to a non-negative real number. A **state**  $s \subseteq \mathcal{F}$  is a set of facts,  $s_{init} \subseteq \mathcal{F}$  is an **initial state** and  $s_{goal} \subseteq \mathcal{F}$  is a **goal** specification. An **operator** o is a triple  $o = \langle \operatorname{pre}(o), \operatorname{add}(o), \operatorname{del}(o) \rangle$ , where  $\operatorname{pre}(o) \subseteq \mathcal{F}$  is a set of preconditions, and  $\operatorname{add}(o) \subseteq \mathcal{F}$  and  $\operatorname{del}(o) \subseteq \mathcal{F}$  are sets of add and delete effects, respectively. All operators are well-formed, i.e.,  $\operatorname{add}(o) \cap \operatorname{del}(o) = \emptyset$  and  $\operatorname{pre}(o) \cap \operatorname{add}(o) = \emptyset$ . An operator o is **applicable** in a state s if  $\operatorname{pre}(o) \subseteq s$ . The **resulting state** of applying an applicable operator o in a state s is the state  $\operatorname{res}(o, s) = (s \setminus \operatorname{del}(o)) \cup \operatorname{add}(o)$ . A state s is a **goal state** iff  $s_{goal} \subseteq s$ .

A sequence of operators  $\pi = \langle o_1, ..., o_n \rangle$  is applicable in a state  $s_0$  if there are states  $s_1, ..., s_n$  such that  $o_i$  is applicable in  $s_{i-1}$  and  $s_i = \operatorname{res}(o_i, s_{i-1})$  for  $1 \le i \le n$ . The resulting state of this application is  $\operatorname{res}(\pi, s_0) = s_n$  and the cost of the plan is  $\operatorname{c}(\pi) = \sum_{o \in \pi} \operatorname{c}(o)$ . A sequence of operators  $\pi$  is called a **plan** iff  $s_{goal} \subseteq \operatorname{res}(\pi, s_{init})$ , and an **optimal plan** is a plan with the minimal cost over all plans.

A state s is called a **reachable state** if there exists an applicable operator sequence  $\pi$  such that  $res(\pi, s_{init}) = s$ . A set of all reachable states is denoted by  $\mathcal{R}_{\Pi}$ .

**Definition 2.** An FDR planning task P is specified by a tuple  $P = \langle \mathcal{V}, \mathcal{O}, s_{init}, s_{goal}, c \rangle$ , where  $\mathcal{V}$  is a finite set of **variables**. Each variable  $V \in \mathcal{V}$  has a finite domain  $D_V$ . A (partial) **state** s is a (partial) variable assignment over  $\mathcal{V}$ . We write vars(s) for the set of variables defined in s and s[V] for the value of V in s. The notation  $s[V] = \bot$  means that  $V \notin \text{vars}(s)$ . A partial state s is **consistent** with a partial state s' if s[V] = s'[V] for all  $V \in \text{vars}(s')$ . We say that **atom** V = v is true in a (partial) state s iff s[V] = v. By c we denote a cost function mapping each operator to a non-negative real number. An **operator**  $o \in \mathcal{O}$  is a pair  $o = \langle \text{pre}(o), \text{eff}(o) \rangle$ , where precondition pre(o) and effect eff(o) are partial assignments over  $\mathcal{V}$ . We require that V = v cannot be both a precondition and an effect. The (complete) state  $s_{init}$  is the **initial state** of the task and the partial state  $s_{goal}$  describes its **goal**.

An operator o is **applicable** in a state s if s is consistent with pre(o). The **resulting** state of applying an applicable operator o in the state s is the state res(o, s) with

$$res(o, s) = \begin{cases} eff(o)[V] & \text{if } V \in vars(eff(o)), \\ s[V] & \text{otherwise.} \end{cases}$$

A sequence of operators  $\pi = \langle o_1, ..., o_n \rangle$  is applicable in a state  $s_0$  if there are states  $s_1, ..., s_n$  such that  $o_i$  is applicable in  $s_{i-1}$  and  $s_i = \text{res}(o_i, s_{i-1})$  for  $1 \le i \le n$ . The resulting

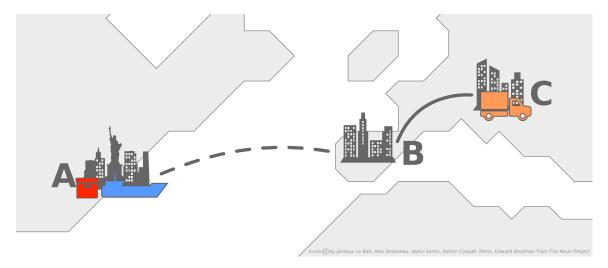

Figure 1: Example problem.

state of this application is  $\operatorname{res}(\pi, s_0) = s_n$  and the cost of the plan is  $\operatorname{c}(\pi) = \sum_{o \in \pi} \operatorname{c}(o)$ . A sequence of operators  $\pi$  is called a **plan** iff  $\operatorname{res}(\pi, s_{init})$  is consistent with  $s_{goal}$ , and an **optimal plan** is a plan with the minimal cost over all plans.

**Definition 3.** Let  $\Pi$  denote a STRIPS planning task. A sequence of operators  $\pi$  is called an s-plan iff  $\pi$  is applicable in a state s and res $(\pi, s)$  is a goal state.

A heuristic  $h: \mathcal{R}_{\Pi} \to \mathbb{R} \cup \{\infty\}$  estimates the cost of optimal s-plans. The **optimal** heuristic  $h^{\star}(s)$  maps each reachable state s to the cost of the optimal s-plan or to  $\infty$  if there is no s-plan. A heuristic h is called (a) **admissible** iff  $h(s) \leq h^{\star}(s)$  for every reachable state  $s \in \mathcal{R}_{\Pi}$ ; (b) **goal-aware** iff  $h(s) \leq 0$  for every reachable goal state s; (c) safe iff  $h(s) = \infty$  implies  $h^{\star}(s) = \infty$ ; and (d) **consistent** iff  $h(s) \leq h(\operatorname{res}(o, s)) + \operatorname{c}(o)$  for all reachable states  $s \in \mathcal{R}_{\Pi}$  and operators  $o \in \mathcal{O}$  applicable in s.

### Exercises

**Ex. 1.1** — Let h denote a heuristic function. Which of the following statements hold?

1. If h is both goal-aware and safe, then h is admissible.

2. If h is both goal-aware and consistent, then h is admissible.

3.If h is both safe and consistent, then h is admissible.

Ex. 1.2 — Model the problem from Fig. 1 in STRIPS.

Ex. 1.3 — Model the problem from Fig. 1 in FDR.

## 2. h<sup>max</sup> Heuristic

**Definition 4.** Given a STRIPS planning task  $\Pi = \langle \mathcal{F}, \mathcal{O}, s_{init}, s_{goal}, c \rangle$ ,  $\Pi^+ = \langle \mathcal{F}, \mathcal{O}^+, s_{init}, s_{goal}, c \rangle$  denotes a **relaxed** STRIPS planning task, where  $\mathcal{O}^+ = \{o_i^+ = \langle \operatorname{pre}(o_i), \operatorname{add}(o_i), \emptyset \rangle \mid o_i \in \mathcal{O}\}$ .

**Definition 5.** Let  $\Pi = \langle \mathcal{F}, \mathcal{O}, s_{init}, s_{goal}, \mathbf{c} \rangle$  denote a STRIPS planning task. The heuristic function  $\mathbf{h}^{\mathrm{add}}(s)$  gives an estimate of the distance from s to a node that satisfies the goal  $s_{goal}$  as  $\mathbf{h}^{\mathrm{add}}(s) = \sum_{f \in s_{goal}} \Delta_0(s, f)$ , where:

$$\Delta_0(s, o) = \sum_{f \in \text{pre}(o)} \Delta_0(s, f), \ \forall o \in \mathcal{O},$$

and

$$\Delta_0(s,f) = \begin{cases} 0 & \text{if } f \in s, \\ \infty & \text{if } \forall o \in \mathcal{O} : f \notin \text{add}(o), \\ \min\{c(o) + \Delta_0(s,o) \mid o \in \mathcal{O}, f \in \text{add}(o)\} & \text{otherwise.} \end{cases}$$

**Definition 6.** Let  $\Pi = \langle \mathcal{F}, \mathcal{O}, s_{init}, s_{goal}, c \rangle$  denote a STRIPS planning task. The heuristic function  $h^{\max}(s)$  gives an estimate of the distance from s to a node that satisfies the goal  $s_{goal}$  as  $h^{\max}(s) = \max_{f \in s_{goal}} \Delta_1(s, f)$ , where:

$$\Delta_1(s, o) = \max_{f \in \text{pre}(o)} \Delta_1(s, f), \ \forall o \in \mathcal{O},$$

and

$$\Delta_1(s,f) = \begin{cases} 0 & \text{if } f \in s, \\ \infty & \text{if } \forall o \in \mathcal{O} : f \notin \text{add}(o), \\ \min\{c(o) + \Delta_1(s,o) \mid o \in \mathcal{O}, f \in \text{add}(o)\} & \text{otherwise.} \end{cases}$$

## Exercises

**Ex. 2.1** — Modify Algorithm 1 to compute h<sup>add</sup> instead of h<sup>max</sup>.

**Ex. 2.2** — Compute  $h^{\max}(s_{init})$ ,  $h^{add}(s_{init})$ ,  $h^+(s_{init})$ , and  $h^*(s_{init})$  for the following problem  $\Pi = \langle \mathcal{F}, \mathcal{O}, s_{init}, s_{goal}, c \rangle$ :

## **Algorithm 1:** Algorithm for computing $h^{max}(s)$ .

```
Input: \Pi = \langle \mathcal{F}, \mathcal{O}, s_{init}, s_{goal}, c \rangle, state s
     Output: h^{max}(s)
  1 for each f \in s do \Delta_1(s, f) \leftarrow 0;
  2 for each f \in \mathcal{F} \setminus s do \Delta_1(s, f) \leftarrow \infty;
  3 for each o \in \mathcal{O}, pre(o) = \emptyset do
          for each f \in add(o) do \Delta_1(s, f) \leftarrow \min{\{\Delta_1(s, f), c(o)\}};
 5 end
 6 for each o \in \mathcal{O} do U(o) \leftarrow |\operatorname{pre}(o)|;
 7 C \leftarrow \emptyset;
 8 while s_{goal} \not\subseteq C do
          k \leftarrow \arg\min_{f \in \mathcal{F} \setminus C} \Delta_1(s, f);
 9
           C \leftarrow C \cup \{k\};
10
           for each o \in \mathcal{O}, k \in pre(o) do
11
                U(o) \leftarrow U(o) - 1;
12
                if U(o) = 0 then
13
                      for each f \in add(o) do
14
                       \Delta_1(s,f) \leftarrow \min\{\Delta_1(s,f), c(o) + \Delta_1(s,k)\};
15
16
                      end
                \quad \text{end} \quad
17
           \quad \text{end} \quad
18
19 end
20 h^{\max}(s) = \max_{f \in s_{goal}} \Delta_1(s, f);
```

### 3. LM-Cut Heuristic

**Definition 7.** A disjunctive operator landmark  $L \subseteq \mathcal{O}$  is a set of operators such that every plan contains at least one operator from L.

**Definition 8.** Let  $\Pi = \langle \mathcal{F}, \mathcal{O}, s_{init}, s_{goal}, c \rangle$  denote a planning task, let  $\Delta_1$  denote the function from Definition 6 for  $\Pi$ , and let  $\operatorname{supp}(o) = \operatorname{arg} \max_{f \in \operatorname{pre}(o)} \Delta_1(s, f)$  denote a function mapping each operator to its **supporter**, where s is the state for which we want to compute the heuristic estimate.

A justification graph G = (N, E) is a directed labeled multigraph with a set of nodes  $N = \{n_f \mid f \in \mathcal{F}\}$  and a set of edges  $E = \{(n_s, n_t, o) \mid o \in \mathcal{O}, s = \text{supp}(o), t \in \text{add}(o)\}$ , where the triple (a, b, l) denotes an edge from a to b with the label l.

An **s-t-cut**  $C(G, s, t) = (N^0, N^* \cup N^b)$  is a partitioning of nodes from the justification graph G = (N, E) such that  $N^*$  contains all nodes from which t can be reached with a zero-cost path,  $N^0$  contains all nodes reachable from s without passing through any node from  $N^*$ , and  $N^b = N \setminus (N^0 \cup N^*)$ .

```
Algorithm 2: Algorithm for computing h^{lm-cut}(s).
```

```
\overline{\mathbf{Input:} \ \Pi} = \langle \mathcal{F}, \mathcal{O}, s_{init}, s_{qoal}, \mathbf{c} \rangle, \text{ state } s
     Output: h^{lm-cut}(s)
 1 if h^{\max}(\Pi, s_{init}) = \infty then
      | h^{\text{lm-cut}}(s) \leftarrow \infty \text{ and terminate};
 3 end
 4 h^{lm-cut}(s) \leftarrow 0;
 5 \Pi_1 = \langle \mathcal{F}' = \mathcal{F} \cup \{I, G\}, \mathcal{O}' = \mathcal{O} \cup \{o_{init}, o_{goal}\}, s'_{init} = \{I\}, s'_{goal} = \{G\}, c_1 \rangle, where
       \operatorname{pre}(o_{init}) = \{I\}, \operatorname{add}(o_{init}) = s, \operatorname{del}(o_{init}) = \emptyset, \operatorname{pre}(o_{goal}) = s_{goal}, \operatorname{add}(o_{goal}) = \{G\},\
       del(o_{goal}) = \emptyset, c_1(o_{init}) = 0, c_1(o_{goal}) = 0, and c_1(o) = c(o) for all o \in \mathcal{O};
 6 i \leftarrow 1;
 7 while h^{\max}(\Pi_i, s'_{init}) \neq 0 do
           Construct a justification graph G_i from \Pi_i;
           Construct an s-t-cut C_i(G_i, n_I, n_G) = (N_i^0, N_i^* \cup N_i^b);
 9
           Create a landmark L_i as a set of labels of edges that cross the cut C_i, i.e., they
10
            lead from N_i^0 to N_i^*;
           m_i \leftarrow \min_{o \in L_i} c_i(o);
11
           h^{lm-cut}(s) \leftarrow h^{lm-cut}(s) + m_i;
12
          Set \Pi_{i+1} = \langle \mathcal{F}', \mathcal{O}', s'_{init}, s'_{goal}, c_{i+1} \rangle, where c_{i+1}(o) = c_i(o) - m_i if o \in L_i, and
13
            c_{i+1}(o) = c_i(o) otherwise;
          i \leftarrow i + 1;
14
15 end
```

#### Exercises

**Ex. 3.1** — Modify Algorithm 1 to compute  $h^{max}$  and to find supporters from Definition 8 at the same time.

**Ex. 3.2** — Compute  $h^{lm-cut}(s_{init})$  for the following problem  $\Pi = \langle \mathcal{F}, \mathcal{O}, s_{init}, s_{goal}, c \rangle$ :

**Ex. 3.3** — Compute  $h^{\max}(s_{init})$ ,  $h^{\lim\text{-cut}}(s_{init})$ ,  $h^+(s_{init})$ , and  $h^*(s_{init})$  for the following problem  $\Pi = \langle \mathcal{F}, \mathcal{O}, s_{init}, s_{goal}, c \rangle$ :

$$\mathcal{F} = \{a, b, c, d, e, i, g\}$$

$$\begin{array}{c|c|c} & \text{pre} & \text{add} & \text{del} & c \\ \hline o_1 & \{i\} & \{a, b\} & \emptyset & 2 \\ o_2 & \{i\} & \{b, c\} & \emptyset & 3 \\ \mathcal{O} = & o_3 & \{a, c\} & \{d\} & \{c\} & 1 \\ o_4 & \{b, d\} & \{e\} & \{b\} & 3 \\ o_5 & \{a, c, e\} & \{g\} & \{c, d\} & 1 \\ o_6 & \{a\} & \{e\} & \{a, c\} & 5 \\ \end{array}$$

$$s_{init} = \{i\}, s_{goal} = \{g\}$$

**Ex. 3.4** — Decide dominance for the following cases:  $h^{max} \geq h^{add}$ ,  $h^{max} \geq h^{lm-cut}$ ,  $h^{max} \geq h^+$ ,  $h^{lm-cut} \leq h^+$ ,  $h^{lm-cut} \geq h^{max}$ .

## 4. Merge And Shrink Heuristic

**Definition 9.** A transition system is a tuple  $\mathcal{T} = \langle S, L, T, I, G \rangle$ , where S is a finite set of states, L is a finite set of labels, each label has  $\mathbf{cost}\ \mathbf{c}(l) \in \mathbb{R}_0^+,\ T \subseteq S \times L \times S$  is a transition relation,  $I \subseteq S$  is a set of initial states, and  $G \subseteq S$  is a set of goal states.

**Definition 10.** Given an FDR planning task  $P = \langle \mathcal{V}, \mathcal{O}, s_{init}, s_{goal}, c \rangle$ ,  $\mathcal{T}(P) = \langle S, L, T, I, G \rangle$  denote a **state space of** P, where S is a set of states over  $\mathcal{V}$ ,  $L = \mathcal{O}$ ,  $T = \{(s, o, t) \mid res(o, s) = t\}$ ,  $I = \{s_{init}\}$ , and  $G = \{s \mid s \in S, s \text{ is consistent with } s_{goal}\}$ .

**Definition 11.** Let  $\mathcal{T}^1 = \langle S^1, L, T^1, I^1, G^1 \rangle$  and  $\mathcal{T}^2 = \langle S^2, L, T^2, I^2, G^2 \rangle$  denote two transition systems with the same set of labels, and let  $\alpha : S^1 \mapsto S^2$ . We say that  $S^2$  is an **abstraction of**  $S^1$  with **abstraction function**  $\alpha$  if for every  $s \in I^1$  it holds that  $\alpha(s) \in I^2$  and for every  $s \in G^1$  it holds that  $\alpha(s) \in G^2$  and for every  $(s, l, t) \in T^1$  it holds that  $(\alpha(s), l, \alpha(t)) \in T^2$ .

**Definition 12.** Let P denote an FDR planning task, let  $\mathcal{A}$  denote an abstraction of a transition system  $\mathcal{T}(P) = \langle S, L, T, I, G \rangle$  with the abstraction function  $\alpha$ . The **abstraction heuristic** induced by  $\mathcal{A}$  and  $\alpha$  is the function  $h^{\mathcal{A},\alpha}(s) = h^{\star}_{\mathcal{A}}(\alpha(s))$  for all  $s \in S$ .

**Definition 13.** Given two transition systems  $\mathcal{T}^1 = \langle S^1, L, T^1, I^1, G^1 \rangle$  and  $\mathcal{T}^2 = \langle S^2, L, T^2, I^2, G^2 \rangle$  with the same set of labels, the **synchronized product**  $\mathcal{T}^1 \otimes \mathcal{T}^2 = \mathcal{T}$  is a transition system  $\mathcal{T} = \langle S, L, T, I, G \rangle$ , where  $S = S^1 \times S^2$ ,  $T = \{((s_1, s_2), l, (t_1, t_2)) \mid (s_1, l, s_2) \in T^1, (s_2, l, t_2) \in T^2\}$ ,  $I = I^1 \times I^2$ , and  $G = G^1 \times G^2$ .

## Algorithm 3: Algorithm for computing merge-and-shrink.

```
Input: P = \langle \mathcal{V}, \mathcal{O}, s_{init}, s_{goal}, c \rangle
Output: Abstraction \mathcal{M}

1 \mathcal{A} \leftarrow \text{Set of (atomic) abstractions } (\alpha_i, \mathcal{T}_i) \text{ of } \mathcal{T}(P);
2 while |\mathcal{A}| > 1 do
3 |A_1 = (\alpha_1, \mathcal{T}_1), A_2 = (\alpha_2, \mathcal{T}_2) \leftarrow \text{Select two abstractions from } \mathcal{A};
4 |\text{Shrink } A_1 \text{ and/or } A_2 \text{ until they are "small enough"};
5 |\mathcal{A} \leftarrow (\mathcal{A} \setminus \{A_1, A_2\}) \cup (A_1 \otimes A_2) \text{ // Merge}
6 end
7 \mathcal{M} \leftarrow \text{The only element of } \mathcal{A};
```

### Exercises

**Ex. 4.1** — Compute the synchronized product of  $\mathcal{T}^1 = \langle S^1, L, T^1, I^1, G^1 \rangle$  and  $\mathcal{T}^2 = \langle S^2, L, T^2, I^2, G^2 \rangle$ , where  $L = \{a, b, c, d, e\}$ ,  $S^1 = \{A, B, C, D\}$ ,  $T^1 = \{(A, a, B), (B, b, C), (C, c, A), (A, d, A), (A, e, D)\}$ ,  $I^1 = \{A\}$ ,  $G^1 = \{A, C\}$ ,  $S^2 = \{X, Y, Z\}$ ,  $T^2 = \{(X, a, Y), (X, a, Z), (Y, b, Z), (Z, c, Y), (Z, d, Y), (Z, e, Z)\}$ ,  $I^2 = \{X\}$ , and  $G^2 = \{X\}$ .

**Ex. 4.2** — Study merge and shrink strategies proposed by Helmert, Haslum, and Hoffmann (2007) and compute  $h^{m\&s}(s_{init})$  for the problem in Fig. 1 (Ex. 1.3).

## 5. LP-Based Heuristics

**Definition 14.** Let  $P = \langle \mathcal{V}, \mathcal{O}, s_{init}, s_{goal}, c \rangle$  denote an FDR planning task. For every variable  $V \in \mathcal{V}$  and every value  $v \in D_V$ , we define:

- A set of operators producing  $\langle V, v \rangle$ :  $\operatorname{prod}(\langle V, v \rangle) = \{o \mid o \in \mathcal{O}, V \in \operatorname{vars}(\operatorname{eff}(o)), \operatorname{eff}(o)[V] = v\}$ , and
- a set of operators consuming  $\langle V, v \rangle$ :  $cons(\langle V, v \rangle) = \{o \mid o \in \mathcal{O}, V \in vars(pre(o)) \cap vars(eff(o)), pre(o)[V] = v, pre(o)[V] \neq eff(o)[V]\}.$

**Definition 15.** Let  $P = \langle \mathcal{V}, \mathcal{O}, s_{init}, s_{goal}, c \rangle$  denote an FDR planning task, and s a state reachable from  $s_{init}$ . Given the following linear program with real-valued variables  $x_o$  for each operator  $o \in \mathcal{O}$ :

$$\begin{split} & \text{minimize} & & \sum_{o \in \mathcal{O}} c(o) x_o \\ & \text{subject to} & & LB_{V,v} \leq \sum_{o \in \text{prod}(\langle V,v \rangle)} x_o - \sum_{o \in \text{cons}(\langle V,v \rangle)} x_o & \forall V \in \mathcal{V}, \forall v \in D_V, \end{split}$$

where

$$LB_{V,v} = \begin{cases} 0 & \text{if } V \in \text{vars}(s_{goal}) \text{ and } s_{goal}[V] = v \text{ and } s[V] = v, \\ 1 & \text{if } V \in \text{vars}(s_{goal}) \text{ and } s_{goal}[V] = v \text{ and } s[V] \neq v, \\ -1 & \text{if } (V \not\in \text{vars}(s_{goal}) \text{ or } s_{goal}[V] \neq v) \text{ and } s[V] = v, \\ 0 & \text{if } (V \not\in \text{vars}(s_{goal}) \text{ or } s_{goal}[V] \neq v) \text{ and } s[V] \neq v, \end{cases}$$

then the value of the flow heuristic  $h^{flow}(s)$  for the state s is

$$\mathbf{h}^{\mathrm{flow}}(s) = \left\{ \begin{array}{cc} \left\lceil \sum_{o \in \mathcal{O}} c(o) x_o \right\rceil & \text{if the solution is feasible,} \\ \infty & \text{if the solution is not feasible.} \end{array} \right.$$

(Bonet, 2013; Bonet & van den Briel, 2014)

**Definition 16.** Let  $P = \langle \mathcal{V}, \mathcal{O}, s_{init}, s_{goal}, \mathbf{c} \rangle$  denote an FDR planning task and s a state reachable from  $s_{init}$ . Given the following linear program with real-valued variables  $P_{V,v}$  for each variable  $V \in \mathcal{V}$  and each value  $v \in D_V$ , and real-valued variables  $M_V$  for each variable  $V \in \mathcal{V}$ :

$$\begin{aligned} & \underset{V \in \mathcal{V}}{\text{maximize}} & & \sum_{V \in \mathcal{V}} P_{V,s_{init}[V]} \\ & \text{subject to} & & P_{V,v} \leq M_V & \forall V \in \mathcal{V}, \forall v \in D_V \\ & & \sum_{V \in \mathcal{V}} maxpot(V,s_{goal}) \leq 0 \\ & & \sum_{V \in \text{vars}(\text{eff}(o))} (maxpot(V,\text{pre}(o)) - P_{V,\text{eff}(o)[V]}) \leq c(o) & \forall o \in \mathcal{O}, \end{aligned}$$

where

$$maxpot(V, p) = \begin{cases} P_{V, p[V]} & \text{if } V \in vars(p), \\ M_V & \text{otherwise} \end{cases}$$

then the value of the **potential heuristic**  $h^{pot}(s)$  for the state s is

$$\mathbf{h}^{\mathrm{pot}}(s) = \begin{cases} \sum_{V \in \mathcal{V}} P_{V,s[V]} & \text{if the solution is feasible,} \\ \infty & \text{if the solution is not feasible.} \end{cases}$$

(Pommerening, Helmert, Röger, & Seipp, 2015; Seipp, Pommerening, & Helmert, 2015)

### Exercises

**Ex. 5.1** — Compute the  $h^{flow}(s_{init})$  and  $h^{pot}(s_{init})$  for the following FDR planning task  $P = \langle \mathcal{V}, \mathcal{O}, s_{init}, s_{goal}, c \rangle$ :

$$\mathcal{V} = \{A, B, C\},\$$

$$D_A = \{D, E\}, D_B = \{F, G\}, D_C = \{H, J, K\},\$$

$$s_{init} = \{A = D, B = F, C = H\}, s_{qoal} = \{A = D, C = K\}$$

$$\mathcal{O} = \{o_1, o_2, o_3, o_4, o_5\},\$$

$$o_1: A = D, C = H \mapsto A = E, C = J, c(o_1) = 2,$$

$$o_2: A = D \mapsto B = G, c(o_2) = 1,$$

$$o_3: B = G, C = J \mapsto C = K, c(o_3) = 1,$$

$$o_4: A = E \mapsto A = D, c(o_4) = 2,$$

$$o_5: C = H \mapsto C = J, c(o_5) = 5.$$

**Ex. 5.2** — How can be flow heuristic improved with landmarks (e.g., from the LM-Cut heuristic)?

**Ex. 5.3** — How can we modify objective of the LP for the potential heuristic so we still obtain admissible estimate for all reachable states?

### 6. Mutual Exclusion Invariants

**Definition 17.** A mutex  $M \subseteq \mathcal{F}$  is a set of facts such that for every reachable state s it holds that  $M \not\subseteq s$ .

**Definition 18.** A mutex group  $M \subseteq \mathcal{F}$  is a set of facts such that for every reachable state s it holds that  $|M \cap s| \leq 1$ . A mutex group that is not subset of any other mutex group is called a maximal mutex group.

**Definition 19.** A fact-alternating mutex group (fam-group)  $M \subseteq \mathcal{F}$  is a set of facts such that  $|M \cap s_{init}| \leq 1$  and  $|M \cap \operatorname{add}(o)| \leq |M \cap \operatorname{pre}(o) \cap \operatorname{del}(o)|$  for every operator  $o \in \mathcal{O}$ . A fam-group that is not subset of any other fam-group is called a **maximal fam-group**.

**Proposition 20.** Every fam-group is a mutex group.

```
Algorithm 4: Inference of fact-alternating mutex groups using ILP.
```

```
Input: STRIPS planning task \Pi = \langle \mathcal{F}, \mathcal{O}, s_{init}, s_{goal}, c \rangle
Output: A set of fam-groups \mathcal{M}

1 Create ILP with a binary variable x_i \in \{0, 1\} for every fact f_i \in \mathcal{F};
2 Add constraint \sum_{f_i \in s_{init}} x_i \leq 1;
3 For each operator o \in \mathcal{O} add constraint \sum_{f_i \in \text{add}(o)} x_i \leq \sum_{f_i \in \text{del}(o) \cap \text{pre}(o)} x_i;
4 Set objective function of ILP to maximize \sum_{f_i \in \mathcal{F}} x_i;
5 M \leftarrow \emptyset;
6 Solve ILP and if a solution was found, save \{f_i \mid f_i \in \mathcal{F}, x_i = 1\} into M;
7 while |M| \geq 1 do
8 | Add M to the output set \mathcal{M};
9 | Add constraint \sum_{f_i \notin M} x_i \geq 1;
10 | M \leftarrow \emptyset;
11 | Solve ILP and if a solution was found, save \{f_i \mid f_i \in \mathcal{F}, x_i = 1\} into M;
```

**Theorem 21.** Algorithm 4 is complete with respect to the maximal fam-groups.

#### Exercises

12 end

Ex. 6.1 — Translate the FDR planning task from Ex. 5.1 into STRIPS.

**Ex. 6.2** — Translate the following STRIPS planning task into FDR:  $\Pi = \langle \mathcal{F}, \mathcal{O}, s_{init}, s_{goal}, c \rangle$ :  $\mathcal{F} = \{a, b, c, d, e, f\}$ 

$$\mathcal{O} = \begin{array}{c|c|c} & \text{pre} & \text{add} & \text{del} & \text{c} \\ \hline o_1 & \{a\} & \{b\} & \{a\} & 1 \\ o_2 & \{b\} & \{a\} & \{b\} & 1 \\ o_3 & \{b\} & \{c\} & \{b\} & 1 \\ o_4 & \{a,d\} & \{f\} & 1 \\ o_5 & \{c,d,f\} & \{e\} & \{d,f\} & 1 \end{array}$$

 $s_{init} = \{b, d\}, s_{goal} = \{e\}$ Try to guess mutex groups.
