# Learning how to ...

**Complex numbers**

**Matrix creation**

**Operations with matrices**

	column 1	column 2	column 3	column 4
row 1	16	2	3	13
row 2	5	11	10	8
row 3	9	7	6	12
row 4	4	14	15	1

**A**

5	11	8
9	7	12
4	14	1

**A([2 3 4], [1 2 4])**

# Complex numbers

- more entry options in Matlab
  - we want to avoid confusion
  - speed

```
>> C5 = sqrt(-1)
```

```
>> C1 = 1 + 1j
>> C2 = 1 + 5i % preferred
>> C3 = 1 + i
>> C4 = 1 + j5
```

- frequently used functions

real, imag	real and imaginary part of a complex number
conj	complex conjugate
abs	absolute value of a complex number
angle	angle in complex plane (in [rad])
complex	constructs complex number from real and imaginary components
isreal	checks if input is a complex number (more on that later)
i, j	complex unit
cplxpair	sorts complex numbers into complex conjugate pairs

# Complex numbers

300 s

- create complex number  $z$  and its complex conjugate

$$z = 1 + 1j$$

$$s = z^*$$

- switch between Cartesian and polar form (find  $|z|, \varphi$  )

$$z = \Re\{z\} + j\Im\{z\} = a + jb$$

$$z = |z|e^{j\varphi}, \quad |z| = \sqrt{a^2 + b^2}$$

$$z = |z|(\cos(\varphi) + j\sin(\varphi))$$

- verify Moivre's theorem

$$z^n = (|z|e^{j\varphi})^n$$

$$z^n = |z|^n (\cos(n\varphi) + j\sin(n\varphi))$$

$$Z = |z| = \sqrt{2} \approx 1.4142$$

$$\varphi = \arctan\left(\frac{\Im\{z\}}{\Re\{z\}}\right) = \arctan\left(\frac{1}{1}\right) \approx 0.7854 \text{ rad}$$

# Complex numbers

300 s

- find out magnitude of a complex vector (avoid indexing)

- use `abs`, `sqrt`

$$\mathbf{Z} = (1+1j \quad \sqrt{2})$$

$$\|\mathbf{Z}\| = ?, \quad \mathbf{Z} \in \mathbb{C}^2$$

$$(1) \quad |Z_x|, |Z_y|$$

$$(2) \quad |\mathbf{Z}| = \sqrt{|Z_x|^2 + |Z_y|^2} = \sqrt{Z_x Z_x^* + Z_y Z_y^*}$$

$$= \sqrt{\mathbf{Z} \cdot \mathbf{Z}^*} = \sqrt{|\mathbf{Z}|^2}$$

- alternatively, use following functions:

- `norm`
- `dot` (*dot product*)
- `hypot` (*hypotenuse*)

# Transpose and matrix conjugate

- Pay attention to situations where the matrix is complex,  $\mathbf{A} \in \mathbb{C}^{M \times N}$
- two distinct operations:

transpose	$\mathbf{A}^T = [A_{ij}]^T = [A_{ji}]$	<code>transpose(A) % &lt;- don't use</code>	<code>A.'</code>
transpose + conjugate	$\mathbf{A}^H = \mathbf{A}_{ij}^H = [\mathbf{A}^*]^T$	<code>ctranspose(A) % &lt;- don't use</code>	<code>A'</code>

```
>> A = magic(2) + 1j*magic(2)'
```

A =

```
1.0000 + 1.0000i    3.0000 + 4.0000i
4.0000 + 3.0000i    2.0000 + 2.0000i
```

```
>> A.'
```

ans =

```
1.0000 + 1.0000i    4.0000 + 3.0000i
3.0000 + 4.0000i    2.0000 + 2.0000i
```

```
>> A'
```

ans =

```
1.0000 - 1.0000i    4.0000 - 3.0000i
3.0000 - 4.0000i    2.0000 - 2.0000i
```

# Entering matrices – „:“

- large vectors and matrices with regularly increasing elements can be typed in using colon operator
  - $a$  is the smallest element („from“),  $incr$  is increment,  $b$  is the largest element („to“)

```
>> A = a:incr:b
```

```
>> A = 1:4:17
```

```
A =
```

```
1    5    9   13   17
```

- $b$  doesn't have to be element of the series in question
  - last element  $N \cdot incr$  then follows the inequality:

$$|a + N \cdot incr| \leq |b|$$

```
>> A = 1:4:7
```

```
A =
```

```
1    5
```

- if  $incr$  is omitted, the increment is set equal to 1

```
>> A = a:b
```

```
>> A = 0:10
```

```
A =
```

```
0    1    2    3    4    5    6    7    8    9   10
```

# Entering matrices

300 s ↑

- Using the colon operator `.,:` “create
  - following vectors

$$\mathbf{u} = (1 \quad 3 \quad \dots \quad 99)$$

$$\mathbf{v} = (25 \quad 20 \quad \dots \quad -5)^T$$

- matrix
  - caution, the third column cant be created using colon operator `:` only

$$\mathbf{T} = \begin{pmatrix} -4 & 1 & \frac{\pi}{2} \\ -5 & 2 & \frac{\pi}{4} \\ -6 & 3 & \frac{\pi}{6} \end{pmatrix}$$

but can be created using `:` and dot operator `.` (we see in the next slides)

# Entering matrices – linspace, logspace

- colon operator defines vector with evenly spaced points
- In the case fixed number of elements of a vector is required, use linspace:

```
>> A = linspace(a, b, N);
```

```
>> A = linspace(0,2,5)
```

```
A =
```

```
0    0.5000    1.0000    1.5000    2.0000
```

- When the N parameter is left out, 100 elements of the vector are generated:

```
>> A = linspace(a, b);
```

- the function logspace works analogically, except that logarithmic scale is used

```
>> A = logspace(a, b, N);
```

# Entering matrices

200 s ↑

- create a vector of 100 evenly spaced points in the interval  $\langle -1.15, 75.4 \rangle$
- create a vector of 201 evenly spaced points in the interval  $\langle 100, -100 \rangle$
- create a vector with spacing of -10 in the interval  $\langle 100, -100 \rangle$ 
  - try both options using `linspace` and colon `:`

# Entering matrices using functions

- special types of matrices of given size are needed quite often
  - Matlab offers number of functions to serve this purpose
- example: matrix filled with zeros
  - will be used quite often

```
zeros(m)                % matrix B of size m×m
zeros(m, n)             % matrix B of size m×n
zeros(m, n, p, ...)    % matrix B of size m×n×p×...
zeros([m n])           % matrix B of size m×n

B = zeros(m, 'single') % matrix B of size m×m, of type 'single'

% see Help for other options
```

# Entering matrices using functions

- following useful functions analogical to the `zeros` function are available

<code>ones</code>	matrix filled with ones
<code>eye</code>	identity matrix
<code>NaN</code> , <code>Inf</code>	matrix filled with NaN, matrix filled with Inf
<code>magic</code>	matrix suitable for Matlab experiments, notice its interesting properties
<code>rand</code> , <code>randn</code> , <code>randi</code>	matrix filled with random numbers coming from uniform and normal distribution, matrix filled with uniformly distributed random integers
<code>randperm</code>	returns a vector containing a random permutation of numbers
<code>diag</code>	creates diagonal matrix or returns diagonal of a matrix
<code>blkdiag</code>	constructs block diagonal matrix from input arguments
<code>cat</code>	groups several matrices into one (depending on dimension)
<code>true</code> , <code>false</code>	creates a matrix of logical ones and zeros
<code>pascal</code> , <code>hankel</code>	Pascal matrix, Hankel matrix

- for further functions see Matlab → Mathematics → Elementary Math → Constants and Test Matrices

# Entering matrices using functions

360 s ↑

- create following matrices
  - use Matlab functions
  - begin with matrices you find easy to cope with

$$\mathbf{M}_1 = \begin{pmatrix} \text{NaN} & \text{NaN} \\ \text{NaN} & \text{NaN} \end{pmatrix}$$

$$\mathbf{M}_2 = (1 \quad 1 \quad 1 \quad 1)$$

$$\mathbf{M}_3 = \begin{pmatrix} 2 & 0 & 0 \\ 0 & 3 & 0 \\ 0 & 0 & -5 \end{pmatrix}$$

$$\mathbf{M}_4 = \begin{pmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ 0 & 0 & 0 & 0 \end{pmatrix}$$

# Entering matrices using functions

360 s ↑

- try to create empty 3-dimensional array of type `double`
  
- can you find another option?

# Entering matrices

- quite often there are several options how to create given matrix
  - it is possible to use output of one function as an input of another function in Matlab:
- consider
  - clarity
  - simplicity
  - speed
  - convention
- e.g. band matrix with '1' on main diagonal and with '2' and '3' on secondary diagonals

```
>> plot(diag(randn(10, 1), 1))
```

```
>> N = 10;
>> diag(ones(N,1)) + diag(2*ones(N-1,1),1) + diag(3*ones(N-1,1),-1)
```

- can be sorted out using `for` cycle as well (see next slides), might be faster ...
- some other idea?

# Dealing with sparse matrices

- Matlab provides support for working with sparse matrices
  - most of the elements of sparse matrices are zeros and it pays off to store them in a more efficient manner

- to create sparse matrix  $S$  out of a matrix  $A$ :

```
S = sparse(A) ,
```

- conversion of a sparse matrix to a full matrix :

```
B = full(S) ,
```

- in the case of need see Help for other functions

# Matrix operations #1

- there are other useful functions apart from transpose (`transpose`) and matrix diagonal (`diag`):

P =

```
0.3404  0.2551  0.9593  0.2575
0.5853  0.5060  0.5472  0.8407
0.2238  0.6991  0.1386  0.2543
0.7513  0.8909  0.1493  0.8143
```

- upper triangular matrix

```
>> U = triu(P),
```

```
>> U = triu(P)
```

U =

```
0.3404  0.2551  0.9593  0.2575
0        0.5060  0.5472  0.8407
0        0        0.1386  0.2543
0        0        0        0.8143
```

- lower triangular matrix

```
>> L = tril(P),
```

```
>> L = tril(P)
```

L =

```
0.3404  0        0        0
0.5853  0.5060  0        0
0.2238  0.6991  0.1386  0
0.7513  0.8909  0.1493  0.8143
```

- a matrix can be modified taking into account secondary diagonals as well

```
>> L = triu(P, -1),
```

```
>> U2 = triu(P, -1)
```

U2 =

```
0.3404  0.2551  0.9593  0.2575
0.5853  0.5060  0.5472  0.8407
0        0.6991  0.1386  0.2543
0        0        0.1493  0.8143
```

# Matrix operations #2

- function `repmat` is used to copy (part of) a matrix

```
>> B = repmat(A, m, n),
```

- e.g.

$$\mathbf{A} = \begin{pmatrix} A_{11} & A_{12} & A_{13} \end{pmatrix}$$

```
>> B = repmat(A, 1, 2),
>> B = repmat(A, [2 1]),
```

$$\begin{pmatrix} A_{11} & A_{12} & A_{13} & A_{11} & A_{12} & A_{13} \end{pmatrix}$$

$$\begin{pmatrix} A_{11} & A_{12} & A_{13} \\ A_{11} & A_{12} & A_{13} \end{pmatrix}$$

- `repmat` is a very fast function
  - comparison of execution time of creating a  $1e4 \times 1e4$  matrix filled with zeros (HW, SW and Matlab version dependent):

```
>> X = zeros(1e4, 1e4);      % computed in 0.18s
>> Y = repmat(0, 1e4, 1e4); % computed in 0.0004s, BUT... don't use it
```

- it is for you to consider the way of matrix allocation ...

# Matrix operations #3

- function `reshape` is used to reshuffle a matrix

```
>> B = reshape(A, m, n),
```

- e.g.

$$\mathbf{A} = \begin{pmatrix} A_{11} & A_{12} \\ A_{21} & A_{22} \end{pmatrix}$$

```
>> B = reshape(A, [4 1]),
>> B = reshape(A, 1, 4),
```

$$\begin{matrix} A_{11} \\ A_{21} \\ A_{12} \\ A_{22} \end{matrix}$$

$$A_{11} \quad A_{21} \quad A_{12} \quad A_{22}$$

# Matrix operations #4

- following functions are used to swap the order of

- columns: `fliplr`

$$\mathbf{A} = \begin{pmatrix} A_{11} & A_{12} & A_{13} \\ A_{21} & A_{22} & A_{23} \end{pmatrix}$$

```
>> B = fliplr(A),
```

$$\mathbf{A} = \begin{pmatrix} A_{13} & A_{12} & A_{11} \\ A_{23} & A_{22} & A_{21} \end{pmatrix}$$

- rows: `flipud`

```
>> B = flipud(A),
```

$$\mathbf{A} = \begin{pmatrix} A_{21} & A_{22} & A_{23} \\ A_{11} & A_{12} & A_{13} \end{pmatrix}$$

- row-wise or column-wise: `flip`

```
>> B = flip(A, 1),
>> B = flip(A, 2),
```

- the same result is obtained using indexing (see next slides)

# Matrix operations #5

- circular shift is also available
  - can be carried out in chosen dimension (row-wise/ column-wise)
  - can be carried out in both directions (back / forth)

$$\mathbf{A} = \begin{pmatrix} A_{11} & A_{12} & A_{13} \\ A_{21} & A_{22} & A_{23} \\ A_{31} & A_{32} & A_{33} \end{pmatrix}$$

```
>> B = circshift(A, -2),
```

$$\mathbf{A} = \begin{pmatrix} A_{31} & A_{32} & A_{33} \\ A_{11} & A_{12} & A_{13} \\ A_{21} & A_{22} & A_{23} \end{pmatrix}$$

```
>> B = circshift(A, [-2 1]),
```

$$\mathbf{A} = \begin{pmatrix} A_{33} & A_{31} & A_{32} \\ A_{13} & A_{11} & A_{12} \\ A_{23} & A_{21} & A_{22} \end{pmatrix}$$

- Consider the difference between flip a circshift

# Matrix operations #1

450 s ↑

- convert the matrix  $\mathbf{A} = \begin{pmatrix} 1 & \pi \\ e & -i \end{pmatrix}$  to have the form of matrices  $\mathbf{A}_1$  to  $\mathbf{A}_4$

- use `repmat`, `reshape`, `triu`, `tril` and `conj`

$$\mathbf{A}_1 = \begin{pmatrix} 1 & \pi & 1 & \pi & 1 & \pi \\ e & -i & e & -i & e & -i \end{pmatrix}$$

$$\mathbf{A}_2 = (1 \quad \pi \quad e \quad -i)$$

$$\mathbf{A}_3 = \begin{pmatrix} 1 & \pi \\ e & +i \\ 1 & \pi \\ e & +i \\ 1 & \pi \\ e & +i \end{pmatrix}$$

$$\mathbf{A}_4 = \begin{pmatrix} 1 & \pi & 0 & 0 & 0 & 0 \\ e & -i & e & 0 & 0 & 0 \\ 0 & \pi & 1 & \pi & 0 & 0 \\ 0 & 0 & e & -i & e & 0 \\ 0 & 0 & 0 & \pi & 1 & \pi \\ 0 & 0 & 0 & 0 & e & -i \end{pmatrix}$$

# Matrix operations #2

450 s ↑

- create following matrix (use advanced techniques)

$$\mathbf{A} = \begin{pmatrix} 1 & 2 & 3 & 1 & 2 & 3 \\ 0 & 2 & 4 & 0 & 2 & 4 \\ 0 & 0 & 5 & 0 & 0 & 5 \end{pmatrix}$$

- save the matrix in file named `'matrix.mat'`
- create matrix **B** by swapping columns in matrix **A**
- create matrix **C** by swapping rows in matrix **B**
- add matrices **B** and **C** in the file `'matrix.mat'`

# Matrix operations #3

150 s ↑

- compare and interpret following commands:

```
>> x = (1:5) .';           % entering vector
>> X = repmat(x, [1 10]), % 1. option
>> X = x(:, ones(10, 1)), % 2. option
```

```
>> x = (1:5)';
x =
     1
     2
     3
     4
     5
```

- repmat is powerful, but not always the most time-efficient function

```
>> X = repmat(x, [1 10])
X =

     1     1     1     1     1     1     1     1     1     1
     2     2     2     2     2     2     2     2     2     2
     3     3     3     3     3     3     3     3     3     3
     4     4     4     4     4     4     4     4     4     4
     5     5     5     5     5     5     5     5     5     5

>> X = x(:, ones(10, 1))
X =

     1     1     1     1     1     1     1     1     1     1
     2     2     2     2     2     2     2     2     2     2
     3     3     3     3     3     3     3     3     3     3
     4     4     4     4     4     4     4     4     4     4
     5     5     5     5     5     5     5     5     5     5
```

# Vector and matrix operations

- remember that matrix multiplication is not commutative, i.e.  $\mathbf{AB} \neq \mathbf{BA}$
- remember that vector  $\times$  vector product results in

$$\mathbf{v}_{M,1} \mathbf{u}_{1,N} = \mathbf{w}_{M,N}$$

	$u_{11}$	$u_{12}$
$v_{11}$	$w_{11}$	$w_{12}$
$v_{21}$	$w_{21}$	$w_{22}$
$v_{31}$	$w_{31}$	$w_{32}$

$$\mathbf{v}_{1,M} \mathbf{u}_{M,1} = w_{1,1}$$

	$u_{11}$
	$u_{21}$
	$u_{31}$
$v_{11}$	$w_{11}$

- ... pay attention to the dimensions of matrices!

# Element-by-element vector product

- it is possible to multiply arrays of the same size in the element-by-element manner in Matlab
  - result of the operation is an array
  - size of all arrays are the same, e.g. in the case of  $1 \times 3$  vectors:

$$\mathbf{a} = (a_1 \quad a_2 \quad a_3) \quad \mathbf{b} = (b_1 \quad b_2 \quad b_3)$$

```
>> a*b
```

$$\begin{bmatrix} a_1 & a_2 & a_3 \end{bmatrix}, \begin{bmatrix} b_1 & b_2 & b_3 \end{bmatrix} \rightarrow$$

Error using \*  
(Inner matrix dimensions must agree.)

```
>> a.*b
```

$$\begin{bmatrix} a_1 & a_2 & a_3 \end{bmatrix}, \begin{bmatrix} b_1 & b_2 & b_3 \end{bmatrix} \rightarrow \begin{bmatrix} a_1b_1 & a_2b_2 & a_3b_3 \end{bmatrix} = [a_i b_i]$$

# Element-by-element matrix product

- if element-by-element multiplication of two matrices of the same size is needed, use the ‘`.*`’ operator
  - i.e. two cases of multiplication are distinguished

$$\gg A * B \quad \begin{bmatrix} A_{11} & A_{12} \\ A_{21} & A_{22} \end{bmatrix}, \begin{bmatrix} B_{11} & B_{12} \\ B_{21} & B_{22} \end{bmatrix} \rightarrow \begin{bmatrix} A_{11}B_{11} + A_{12}B_{21} & A_{11}B_{12} + A_{12}B_{22} \\ A_{21}B_{11} + A_{22}B_{21} & A_{21}B_{12} + A_{22}B_{22} \end{bmatrix}$$

$$\gg A .* B \quad \begin{bmatrix} A_{11} & A_{12} \\ A_{21} & A_{22} \end{bmatrix}, \begin{bmatrix} B_{11} & B_{12} \\ B_{21} & B_{22} \end{bmatrix} \rightarrow \begin{bmatrix} A_{11}B_{11} & A_{12}B_{12} \\ A_{21}B_{21} & A_{22}B_{22} \end{bmatrix}$$

- It is so called *Hadamard product* / *element-wise product* / *Schur product*:  $\mathbf{A} \circ \mathbf{B}$

# Compatible Array Sizes

- From R2016b most two-input (binary) operators support arrays that have *compatible sizes*
  - variables has compatible sizes if its sizes are either the same or one of them is 1 (for all dimensions)
- Examples:
  - $\circ$  is arbitrary two-input element-wise operator (+, -, .\*, ./, &, <, ==, ...)

# Element-wise operations #1

- element-wise operations can be applied to vectors as well in Matlab. Element-wise operations can be usefully combined with vector functions
- it is possible, quite often, to eliminate 1 or even 2 for-loops!!!
- these operations are exceptionally efficient  
→ allow the use of so called vectorization (see later)

- e.g.:  $f(x) = \frac{10}{(x+1)} \tan(x),$   
 $x \in \left[ -\frac{\pi}{4}, \frac{\pi}{4} \right]$

```
>> x = -pi/4:pi/100:pi/4;
>> fx = 10./(1+x).*tan(x);
>> plot(x, fx);
>> grid on;
```

# Element-wise operations #1

300 s ↑

- evaluate functions  $f_1(x) = \sin(x)$  of the variable  $x \in [0, 2\pi]$   
 $f_2(x) = \cos^2(x)$   
 $f_3(x) = f_1(x) + f_2(x)$
- evaluate the functions in evenly spaced points of the interval, the spacing is  $\Delta x = \pi/20$

- for verification:

```
>> plot(x, f1, x, f2, x, f3),
```

- Matlab also enables symbolic solution (see later)

# Element-wise operations #2

240 s ↑

- depict graphically following functional dependence in the interval

$$x \in [0, 5\pi]$$

- plot the result using following function

$$f_4(x) = \frac{-\cos(3x)}{\cos(x)\sin\left(x - \frac{\pi}{5}\right) - \pi}$$

```
>> plot(x, f4);
```

- explain the difference in the way of

```
>> A*B,
```

```
>> A.*B,
```

```
>> A'.*B,
```

multiplication of matrices of the same size

# Element-wise operations #3

360 s

- evaluate the function  $f(x, y) = xy$ ,  $x, y \in [0, 2]$ , use 101 evenly spaced points in both  $x$  and  $y$
- the evaluation can be carried out either using vectors, matrix element-wise vectorization or using two for loops
  - plot the result using `surf(x, y, f)`
  - when ready, try also  $f(x, y) = x^{0.5}y^2$  on the same interval

# Matrix operations

- construct block diagonal matrix: `blkdiag`

$$\begin{matrix} A_{11} \\ B_{11} & B_{12} \\ B_{21} & B_{22} \end{matrix}$$

```
>> A = 1; B = [2 3; -4 -5];
>> C = blkdiag(B, A);
```

$$\begin{matrix} B_{11} & B_{12} & 0 \\ B_{21} & B_{22} & 0 \\ 0 & 0 & A_{11} \end{matrix}$$

- arranging two matrices of the same size: `cat`

$$\begin{matrix} A_{11} & A_{12} \\ A_{21} & A_{22} \end{matrix}$$

$$\begin{matrix} B_{11} & B_{12} \\ B_{21} & B_{22} \end{matrix}$$

```
C = cat(2, A, B)
C = cat(1, A, B)
C = cat(3, A, B)
```

$$\begin{matrix} A_{11} & A_{12} & B_{11} & B_{12} \\ A_{21} & A_{22} & B_{21} & B_{22} \end{matrix}$$

$$\begin{matrix} A_{11} & A_{12} \\ A_{21} & A_{22} \\ B_{11} & B_{12} \\ B_{21} & B_{22} \end{matrix}$$

$$\begin{matrix} A_{11} & A_{12} & & \\ A_{21} & A_{22} & & \\ & & B_{11} & B_{12} \\ & & B_{21} & B_{22} \end{matrix}$$

# Size of matrices and other structures

- it is often needed to know size of matrices and arrays in Matlab
- function `size` returns a vector giving the size of the matrix / array

```
>> A = randn(3, 5);
>> d = size(A) % d = [3 5]
```

- function `length` returns largest dimension of an array
  - i.e. `length(A) = max(size(A))`

```
>> A = randn(3, 5, 8);
>> e = length(A) % e = 8
```

- function `ndims` returns number of dimensions of a matrix / array
  - i.e. `ndims(A) = length(size(A))`

```
>> m = ndims(A) % m = 3
```

- function `numel` returns number of elements of a matrix / array
  - i.e. `numel(A) = prod(size(A))`

```
>> n = numel(A) % n = 120
```

# Size of matrices and other structures

250 s ↑

- create an arbitrary 3D array
  - you can make use of the following commands :

```
>> A = rand(2+randi(10), 3+randi(5));  
>> A = cat(3, A, flipud(fliplr(A)))
```

- and now:
  - find out the size of A
  - find out the number of elements of A
  - find out the number of elements of A in the 'longest' dimension
  - find out the number of dimensions of A

# Data types in Matlab

- can be postponed for later ...

```
>> whos
```

# Bonus: function gallery

---

- function enabling to create a vast set of matrices that can be used for Matlab code testing
- most of the matrices are special-purpose
  - function gallery offers significant coding time reduction for advanced Matlab users
- see `help gallery` / `doc gallery`
- **try** for instance:

```
>> gallery('pei', 5, 4)
>> gallery('leslie', 10)
>> gallery('clement', 8)
```

# Function why

---

- it is a must to try that one! :)
- try help `why`
- try to find out how many answers exist

# Discussed functions

---

real, imag, cong, angle, complex	complex numbers related functions	
norm, cumsum	norm (of a matrix / vector), cummulative sum	•
hypot	square root of sum of squares (real / complex numbers)	
linspace, logspace	vector generation - evenly spaced, linear / logarithmic scale	
zeros, ones, eye, NaN, magic	create matrix	
rand, randn, randi	matrix of random numbers with uniform or normal distribution, matrix of random integers	
randperm	vector containing a random permutation of numbers	
true, false	create matrix (logical)	
pascal, hankel, gallery	special purpose matrices	•
blkdiag, cat	block diagonal matrix, groups several matrices into one	
diag, triu, tril,	diagonal matrix, upper and lower triangular matrix	•
fliplr, flipud, circshift	element swapping, circular shift	
repmat, reshape	matrix operation (replication, reshaping)	•
length, size, ndims, numel	length of a vector, size of a matrix, number of dim. and elements	
sparse, full	sparse and full matrix operations	
grid on, grid off	Turns grid of a graph on / off	
figure, surf	opens new figure, 3D graph surf	•

---

# Exercise #1

360 s ↑

- create matrix  $\mathbf{M}$  of size  $\text{size}(\mathbf{M}) = [3 \ 4 \ 2]$  containing random numbers coming from uniform distribution on the interval  $[-0.5, 7.5]$

# Exercise #2

200 s

- Consider the operation  $a1 \wedge a2$ , is this operation applicable to following cases?
  - $a1$  – matrix,  $a2$  – scalar
  - $a1$  – matrix,  $a2$  – matrix
  - $a1$  – matrix,  $a2$  – vector
  - $a1$  – scalar,  $a2$  – scalar
  - $a1$  – scalar,  $a2$  – matrix
  - $a1, a2$  – matrix,  $a1 \cdot a2$

you can always create the matrices  $a1, a2$  and make a test ...

# Exercise #3

420 s ↑

- make corrections to the following piece of code to get values of the function  $f(x)$  for 200 points on the interval  $[0, 1]$  :

$$f(x) = \frac{x^2 \cos(\pi x)}{(x^3 + 1)(x + 2)}$$

- find out the value of the function for  $x = 1$  by direct accessing the vector
- what is the value of the function for  $x = 2$ ?
- to check, plot the graph of the function  $f(x)$

```
>> % erroneous code
>> x = linspace(0, 1);
>> clear;
>> g = x^3+1; H = x+2;
>> y = cos xpi; z = x.^2;
>> f = y*z/gh
```

$$f(1) = -\frac{1}{6} \approx -0.1667$$

$$f(2) = \frac{1}{9} \approx 0.1111$$

# Exercise #4

200 s ↑

- think over how many ways there are to calculate the length of the hypotenuse when two legs of a triangle are given
- make use of various Matlab operators and functions
- consider also the case where the legs are complex numbers

## Exercise #5

- A proton, carrying a charge of  $Q = 1.602 \cdot 10^{-19} \text{ C}$  and of a mass of  $m = 1.673 \cdot 10^{-31} \text{ kg}$  enters a homogeneous magnetic and electric field in the direction of the  $z$  axis in the way that the proton follows a helical path; the initial velocity of the proton is  $v_0 = 1 \cdot 10^7 \text{ m/s}$ . The intensity of the magnetic field is  $B = 0.1 \text{ T}$ , the intensity of the electric field is  $E = 1 \cdot 10^5 \text{ V/m}$

- velocity of the proton along the  $z$  axis is 
$$v = \frac{QE}{m}t + v_0$$

- where  $t$  is time, travelled distance along the  $z$  axis is 
$$z = \frac{1}{2} \frac{QE}{m}t^2 + v_0t$$

- radius of the helix is 
$$r = \frac{vm}{BQ}$$

- frequency of orbiting the helix is 
$$f = \frac{v}{2\pi r}$$

- the  $x$  and  $y$  coordinates of the proton are 
$$x = r \cos(2\pi f t), \quad y = r \sin(2\pi f t)$$

# Exercise #6

500 s ↑

- plot the path of the proton in space in the time interval from 0 ns to 1 ns in 1001 points using function `comet3(x, y, z)`

```
>> clear; close all; clc;
```

```
>> % put your code here  
>> % ...  
>> % ...  
>> % ...  
>> % ...  
>> % ...  
>> % ...  
>> % ...  
>> % ...  
>> % ...  
>> % ...  
>> % ...  
>> % ...
```

```
>> comet3(x, y, z)
```

# Thank you!
