# **Version Control Systems**

Jan Faigl

Department of Computer Science Faculty of Electrical Engineering Czech Technical University in Prague

Lecture 14

B0B36PRP - Procedurální programování

## Overview of the Lecture

■ Part 1 – Version Control Systems

Introduction and Terminology

Version Control Systems

SVN - Subversion

Versioning

## Part I

Part 1 – Version Control Systems (VCSs)

B0B36PRP - Lecture 14: Version Control Systems

Jan Faigl, 2018

actual

B0B36PRP - Lecture 14: Version Control Systems

VCS

VCS

## What is Version Control?

- Working on a project or an assignment, we can tend to "backup" our early achievements mostly "just for sure"
  - hw01
  - hw01.backup
  - hw01.old
  - hw01.old2
  - hw01.old3
- Třídit podle názvu
- We may try a new approach, e.g., for optional assignment, but we would like to preserve the previous (working) approach
- We may also want to backup the files to avoid file/work lost in a case of hard/solid drive failure We need to save it to a reliable medium
- Finally, we need a way how to distribute and communicate our changes to other members of the team

## Version Control System

- Version Control System (VCS) is a tool or set of tools that provides management of changes to files over time
  - Uniquely identified changes (what)
  - Time stamps of the changes (when)
  - Author of the changes (who)
- VCS can be
  - Manual (by hand) e.g., "save as"
    - Creating multiple copies of files and changes documented in an
    - Backups of the file systems (e.g., snapshots)
    - Files shared between team members
  - Automated version control
    - System or application manages changes
    - Version tracking is managed internally by the system or application
    - It may provide further support for collaboration (team development)

B0B36PRP - Lecture 14: Version Control Systems

\$ cd work

B0B36PRP - Lecture 14: Version Control Systems

B0B36PRP - Lecture 14: Version Control Systems

History Overview

VCS

■ 1972 – Source Code Control System (SCCS)

UNIX

5 / 47

Jan Faigl, 2018

Jan Faigl, 2018

- Store changes using deltas
- Keeps multiple versions of a complete directory
- Keeps original documents and changes from one version to the next
- 1982 Revision Control System (RCS)

- Keeps the current version and applies changes to go back to older
- Single file at a time
- - Start as scripts on top of the RCS
- versions
- 1986 Concurrent Versions Systems (CVS)
  - Handle multiple files at a time Client-Server architecture

- co -l file check out a file and lock it
  - Locking by means the file can be checked back in
- ci file check in a revision (put the file under rcs control)
- rcs -1 file lock a file already checked out

Revision Control System (RCS) – Commands

■ Create a directory for storing rcs files, e.g., /etc

- rcsdiff files report on differences between files
- merge files merge two files into an original file

The results has to be checked, it is not a magic!

B0B36PRP - Lecture 14: Version Control Systems

# Benefits of Version Control System (VCS)

- VCS provides numerous benefits for both working environment (individual and team)
- Individual benefits
  - Backups with tracking changes
  - Tagging marking the particular version in time
  - Branching multiple versions
  - Tracking changes
  - Revert (undo) changes
- Team benefits
  - Working on the same code sources in a team of several developers
  - Merging concurrent changes
  - Support for conflicts resolution when the same file (the same part of the file) has been simultaneously changed by several developers
  - Determine the author and time of the changes

## Revision Control System (RCS) – Example

```
4 $ mkdir RCS
 5 $ ci -u main.sh
 6 RCS/main.sh.v <-- main.sh
     enter description, terminated with single '.' or end of file:
     NOTE: This is NOT the log message!
     >> My main script
     initial revision: 1.1
    done
$ 1s RCS
13
14
15 $ echo "echo 'My script'" >> main.sh
17 $ rcsdiff main.sh
     RCS file: RCS/main.sh,v
     retrieving revision 1.1
diff -r1.1 main.sh
     1a2
> My script
     RCS/main.sh,v <-- main.sh
new revision: 1.2; previous revision: 1.1
```

enter log message, terminated with single '.' or end of file:

>> Add the debug message

31 done

B0B36PRP - Lecture 14: Version Control Systems

Version Control System (VCS) is a set of tools (commands) for

interaction with the repository and location files (copies of the

Local command or in the case of the repository also a server

## Terminology - VCS Vocabulary

- Repository the database storing the files and deltas
- Working (Local) copy of the versioned files
  - An user works with a copy of the versioned files to modify them

We can further distinguish local and working copy of the repository (versioned files) for particular VCS. E.g., subversion in addition to working copy also keeps local copy of the files in the .swn directory with the version of the files the developer is currently working on. Git keeps a local copy of the repository in

- Trunk The primary location for the particular project files in the
- Branch A secondary code location (for a variant of the project)
- Revision A version of the a file (or repository)
- Commit Storing a bunch of changes to the repository
- Revert Roll back a commit from the repository
- Merge Pulling changes from one branch into another
- Conflict When a file cannot be merged cleanly (automagicaly)

lan Faigl, 2018 VCS

Jan Faigl, 2018

versioned files)

service

Repository

Tool is a command or icon or an item in the menu

Usually as deltas, which store differences, and thus save file size

VCS

an Faigl, 2018

Local/Working Copy

Versioning Files

Local/Working Copy

Local/Working Copy

Repository and Version Control

## Getting Local/Working Copy - checkout

- Create a local copy of the versioned files from the repository
- Directory tree of the local copy usually contains additional files with the information about the versioned files, revisions, and repository, e.g., .git or .svn
- Then, by modifying checkouted files, we modify the local copies of the particular version of the files

lan Faigl, 2018

Local/Working Copy

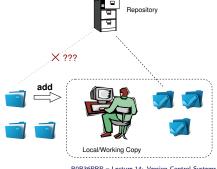

## Adding a File to the Version Control – add

All changes are stored in the repository

Repository can be remote or local

■ It is necessary to inform the version control system to track particular files under version control

> Without explicit adding files, the VCS does not know which files we would like to keep under version control and which not

## Confirm Changes to the Repository – **commit**

- Request to accept the local modifications as a new revision of the files
- Version control system creates the closest higher version, e.g., with the revision number about one higher
- For the case there is not a newer revision in the repository (according to the local copy of the repository modified locally), changes are propagated to the repository; Otherwise:
  - Update the locally copy of the versioned files to the newer version from the repository
  - If mergers are not handled automagically, it is necessary to handle conflicts

Local/Working Copy

Notice, each commit should be commented by a meaningful, clear

B0B36PRP - Lecture 14: Version Control Systems lan Faigl, 2018

## Update the Local Version of the Files from the Repository update

- Update the current local copy of the versioned files from the repository to a newer (or specified) revision from the repository
- If changes of the versioned files is compatible with local modifications, files are automagically merged
- Otherwise it is necessary to manage the conflicts and select the correct version manually

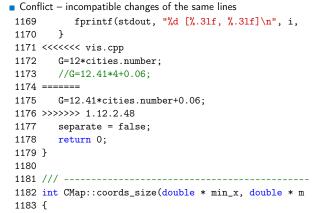

Local/Working Copy

Resolving Conflicts

- Version Control System (VCS) does not prevent the conflicts, but it provides tools for resolving the conflicts
- Conflict is usually caused by simultaneous modification of the same part in the source file
- Conflicts can be avoided by suitable structure of the source files, using modules, and the overall organization of the project files and
- Conflicts can be further avoided by specifying access rights to particular files and developers (authorization)

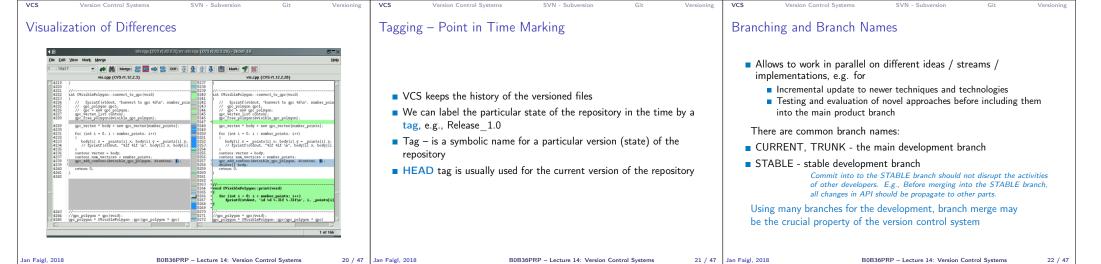

## Example of the Merge File with Marked Conflict

B0B36PRP - Lecture 14: Version Control Systems

VCS

B0B36PRP - Lecture 14: Version Control Systems

# Example of Branches

### lan Faigl, 2018 B0B36PRP - Lecture 14: Version Control Systems Version Control Systems

- Central repository approach the main repository is the only source and only the main repository has the complete file history
- Users checkout local copies of the current version
- It includes authorization to particular directories
- It revision id is a number for a whole repository
- Tags and branches are directories (cheap-copy)
- Allows easy and straightforward multiple versions (branches/tags) alongside
- Git

Jan Faigl, 2018

Subversion

VCS

- Distributed repository approach every checkout of the repository is a full repository with complete history
- Greater redundancy with higher speed

Subversion and Git - Main Difference

■ Branching and merging repositories is more heavily used

Branches and tags are "markers" of the subset of the repository

What the best fits your needs depends on the way how you expect to use it. It also holds for single user usage. Imagine a situation with a single main laptop (do not rely on single HDD/SSD). Or a situation with several workstations and laptops.

Learn what you need!

available for download or on-line readings

28 / 47

# Example of VCS

- Sometimes may also be called as Source Code Manager (SCM)
- Many VCSs exist as both free/open source and proprietary https://en.wikipedia.org/wiki/List\_of\_version\_control\_software
- Local only: SCCS (1972), RCS (1982), PVCS¹ (1985), QVCS¹ (1991)
- Client-server: CVS (1986), ClearCase<sup>1</sup> (1992), Perforce<sup>1</sup> (1995), Subversion (2000), Surround SCM1 (2002), Visual Studio Team Services1 (2014)
- Distributed: BitKeeper (1998), Darcs (2002), SVK (2003), Bazaar (2005), Mercurial (2005), Git (2005), Plastic SCM1 (2006), Visual Studio Team Services (2014)1
- Free/open-source Subversion, Git

Version Control Systems

■ Proprietary – Surround SCM, Plastic SCM

http://www.seapine.com/surround-scm/overview, https://www.plasticscm.com

It is good to known and be aware what systems are available and what are their limitations and features. Knowledge of fundamental principles may help you to make a right choice.

https://en.wikipedia.org/wiki/Comparison\_of\_version\_control\_software

B0B36PRP - Lecture 14: Version Control Systems an Faigl, 2018 26 / 47 SVN - Subversion

## Subversion

- http://subversion.apache.org
- Apache Subversion 1.9.5 Release (2016-11-29)
  - Milestone 1 September 2000,
  - Subversion 0.8 January 2002,
  - Subversion 0.37 (1.0.0-RC1) January 2004,
  - Subversion 1.0.0 February 2004,
  - Subversion 1.1.0 September 2004
  - Subversion 1.2.0 May 2005.

  - Subversion 1.3.0 January 2006,
  - Subversion 1.4.0 September 2006,
  - Subversion 1.5.0 June 2008.
  - Subversion 1.6.0 March 2009
  - Subversion 1.7.0 October 2011 (Apache Foundation),
  - Subversion 1.8.0 June 2012.
  - Subversion 1.9.0 August, 2015

https://subversion.apache.org/docs/release-notes/release-history.html

B0B36PRP - Lecture 14: Version Control Systems

## Git – Development Process of the Linux Kernel Model with a Huge Number of Developers

## Git – Properties and Features

- Local repository allows versioning without network connection
  - The central repository is substituted by a responsible developer
- Commit only adds the changes to the local repository therefore it is necessary to propagate the changes to the upstream using git
- Can be efficient for large projects But it may also not be suitable
- Files are stored as objects in a database (INDEX)
  - SHA1 fingerprints as file identifiers
- Low-level operations on top of the database are encapsulated by more user-friendly interface
- Support development a high usage of branches
- Support for applying path sets , e.g., delivered by e-mails
- Tags and Branches are marked points/states of the repository
- Suitability of the Git deployment depends on the project and model of the development

- The previous versions of the file are kept in the repository as a part of the history
- The real deletion of the file is not possible (straightforwardly)

Obliterate feature is planned for Subversion vers. 2.0?

https://subversion.apache.org/roadmap.html

## Distributed Version Control System (DVCS)

- DVCS does not necessarily have a central repository
- Each developer keeps its own *local* repository
- It is usually very often to use branches
- The final version of the project is a compilation of particular branches of individual developers
- Beside Git, there are several another systems:
  - Bazaar bzr
  - Monotone http://monotone.ca.
  - SVK based on Subversion

http://elixus.org/

- Darcs (darcs) David's Advanced Revision Control System http://darcs.net Written in Haskell
- Mercurial http://www.selenic.com/mercurial/wiki
- BitKeeper http://www.bitkeeper.com.
- Perforce, Plastic SCM proprietary software
- Git git created for developing the Linux kernel http://git-scm.com

lan Faigl, 2018 B0B36PRP - Lecture 14: Version Control Systems

## Git - Usage

- git clone path to git repository create a copy of the repository (in .git directory)
- git remote setup of the repository following (git fetch)
- git help command get help info about a particular command
- git add, git status, git log, git merge, git rm commands for developing and local versioning
- git checkout *files* update the files from the repository
- git branch branch name initial a new branch based on the current revision
- git pull update local repository with new revision at the remote repository
- git push propagate local repository to a remote repository

Wrap-Up — What You Can Put under Version Control?  Source codes of your programs Versioning of the Third-party libraries  Even though it make more sense to version source files, i.e., text files, you can also versioning binary files, but you cannot expect a straightforward diff. Versioning documents (text/binary) File and Directory Layout for Storing a Scientific Paper in Subversion  http://blog.plesslveb.ch/post/6628076310/file-and-directory-layout-for-storing-a-scientific You should definitely put sources of your diploma or bachelor thesis under version control  Also as a sort of backup  Even you will use it only for your thesis, TEX or BTEX should be your option.  Repository and version control as an additional "backuping"  Repository on the server may usually be located on backuped and reliable disk system.  Versioning can be used as a tool for sharing files  Be aware that files are persistent in the repository!
