Path Planning Methods

Piano Mover's Problem

A classical motion planning problem

Having a CAD model of the piano, model of the environment, the problem is how to move the piano from one place to another without hitting anything.

Basic motion planning algorithms are focused primarily on rotations and translations.

- We need notion of model representations and formal definition of the problem.
- Moreover, we also need a context about the problem and realistic assumptions.

The plans have to be admissible and feasible.

Jan Faigl, 2018 Introduction to Path Planning B4M36UIR - Lecture 03: Path Planning Path Planning Methods

Real Mobile Robots

In a real deployment, the problem is a more complex.

- The world is changing
- Robots update the knowledge about the environment

localization, mapping and navigation

- New decisions have to made
- A feedback from the environment Motion planning is a part of the mission replanning loop.

Josef Štrunc, Bachelor thesis, CTU, 2009.

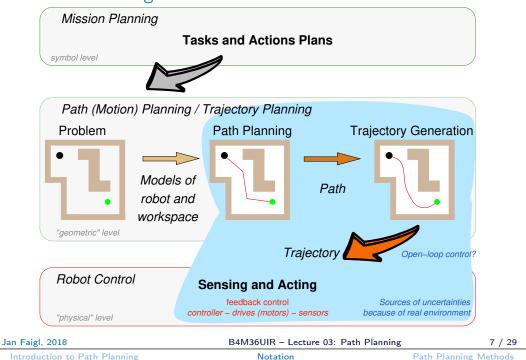

An example of robotic mission:

Multi-robot exploration of unknown environment

How to deal with real-world complexity?

Relaxing constraints and considering realistic assumptions.

Robotic Planning Context

Notation

 \mathbf{W} – World model describes the robot workspace and its boundary determines the obstacles \mathcal{O}_i .

2D world. $\mathcal{W} = \mathbb{R}^2$

- A **Robot** is defined by its geometry, parameters (kinematics) and it is controllable by the motion plan.
- $\square C$ Configuration space (*C*-space)

A concept to describe possible configurations of the robot. The robot's configuration completely specify the robot location in ${\cal W}$ including specification of all degrees of freedom.

E.g., a robot with rigid body in a plane $C = \{x, y, \varphi\} = \mathbb{R}^2 \times S^1$.

- Let \mathcal{A} be a subset of \mathcal{W} occupied by the robot, $\mathcal{A} = \mathcal{A}(q)$.
- A subset of C occupied by obstacles is

$$\mathcal{C}_{obs} = \{ q \in \mathcal{C} : \mathcal{A}(q) \cap \mathcal{O}_i, orall i \}$$

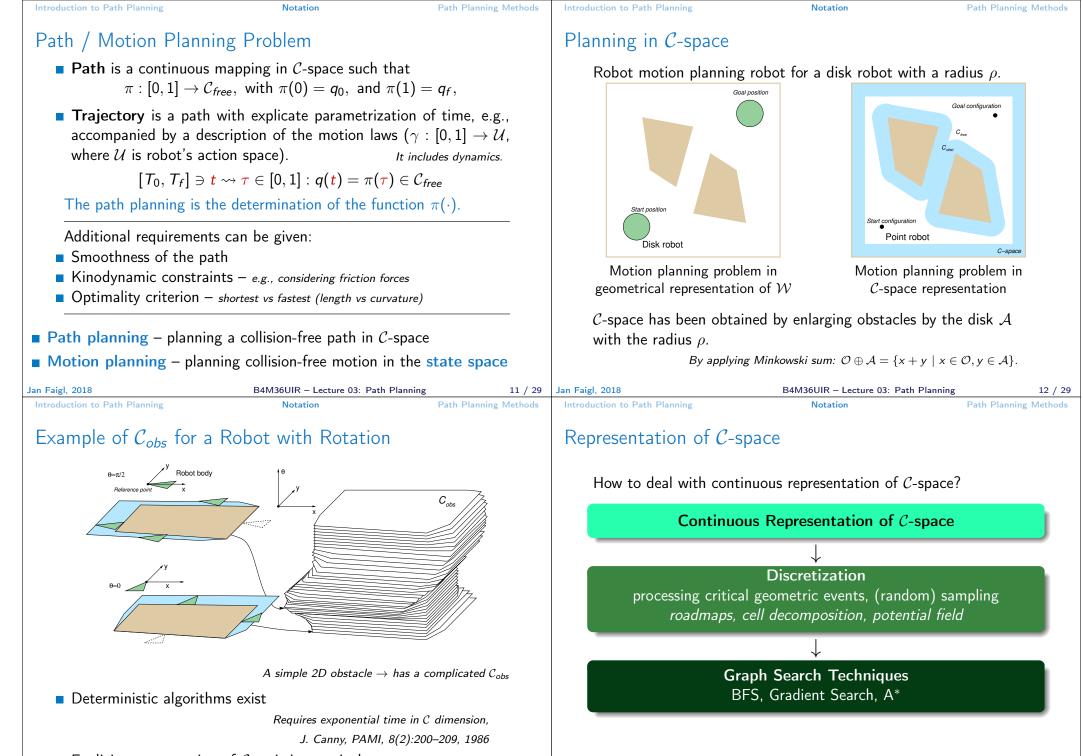

Collision-free configurations are

$$\mathcal{C}_{\textit{free}} = \mathcal{C} \setminus \mathcal{C}_{\textit{obs}}$$

Jan Faigl, 2018

B4M36UIR - Lecture 03: Path Planning

8 / 29 Jan Faigl, 2018

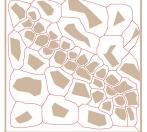

• Explicit representation of C_{free} is impractical to compute.

Voronoi Graph	Visibility Graph vs Voronoi Graph Visibility graph		
 Roadmap is Voronoi graph that maximizes clearance from the obstacles Start and goal positions are connected to the graph Path is found using a graph search algorithm 	 Shortest path, but it is close to obstacles. We have to consider safety of the path An error in plan execution can lead to a collision. Complicated in higher dimensions Voronoi graph It maximize clearance, which can provide 		

Voronoi graph

Path in graph

Found path

Complicated in higher dimensions

changes in the graph

conservative paths

Small changes in obstacles can lead to large

For higher dimensions we need other roadmaps.

A combination is called Visibility-Voronoi – R. Wein,

Introduction to Path Planning

Path Planning Methods

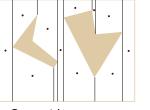

Cell Decomposition

1. Decompose free space into parts.

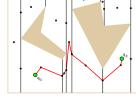

Any two points in a convex region can be directly connected by a segment.

- 2. Create an adjacency graph representing the connectivity of the free space.
- 3. Find a path in the graph.

Trapezoidal decomposition

Centroids represent cells

Connect adjacency cells

Find path in the adjacency graph

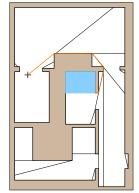

Other decomposition (e.g., triangulation) are possible.

Shortest Path Map (SPM)

Speedup computation of the shortest path towards a particular goal location p_g for a polygonal domain \mathcal{P} with *n* vertices

Notation

- A partitioning of the free space into cells with respect to the particular location p_{g}
- Each cell has a vertex on the shortest path to p_{g}
- Shortest path from any point *p* is found by determining the cell (in $O(\log n)$ using point location alg.) and then travesing the shortest path with up to k bends, i.e., it is found in $O(\log n + k)$
- Determining the SPM using "wavefront" propagation based on continuous Dijkstra paradigm

Joseph S. B. Mitchell: A new algorithm for shortest paths among obstacles in the plane, Annals of Mathematics and Artificial Intelligence, 3(1):83-105, 1991.

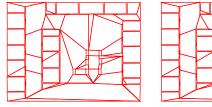

- SPM is a precompute structure for the given \mathcal{P} and p_{σ}
 - single-point query

A similar structure can be found for two-point query, e.g., H. Guo, A. Maheshwari, J.-R. Sack, 2008

Jan Faigl, 2018	B4M36UIR – Lecture 03: Path Planning	20 / 29	Jan Faigl, 2018	B4M36UIR – Lecture 03: Path Planning	21 / 29

Point Location Problem

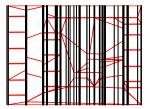

For a given partitioning of the polygonal domain into a discrete set of cells, determine the cell for a given point p

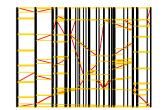

Masato Edahiro, Iwao Kokubo and Takao Asano: A new point-location algorithm and its practical efficiency: comparison with existing algorithms, ACM Trans. Graph., 3(2):86-109, 1984.

It can be implemented using interval trees – slabs and slices

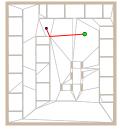

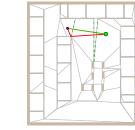

Point location problem, SPM and similarly problems are from the Computational Geometry field

B4M36UIR - Lecture 03: Path Planning

Approximate Shortest Path and Navigation Mesh

- We can use any convex partitioning of the polygonal map to speed up shortest path queries
 - Precompute all shortest paths from map vertices to p_g using visibility graph
 - Then, an estimation of the shortest path from p to p_g is the shortest path among the one of the cell vertex

The estimation can be further improve by "ray-shooting" technique combined with walking in triangulation (convex partitioning)

(Faigl, 2010)

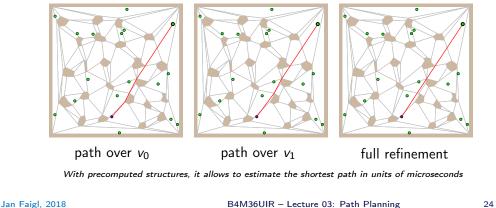

Introduction to Path Planning

Notation

Path Planning Methods

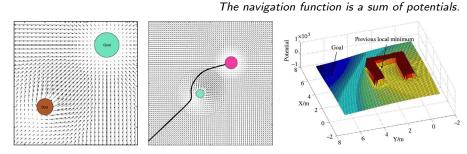

Path Refinement

- Testing collision of the point p with particular vertices of the estimation of the shortest path
 - Let the initial path estimation from p to pg be a sequence of k vertices (p, v1,..., vk, pg)
 - We can iteratively test if the segment (p, v_i), 1 < i ≤ k is collision free up to (p, p_g)

Artificial Potential Field Method

- The idea is to create a function f that will provide a direction towards the goal for any configuration of the robot.
- Such a function is called navigation function and $-\nabla f(q)$ points to the goal.
- Create a potential field that will attract robot towards the goal q_f while obstacles will generate repulsive potential repelling the robot away from the obstacles.

Such a potential function can have several local minima.

B4M36UIR – Lecture 03: Path Planning

27 / 29

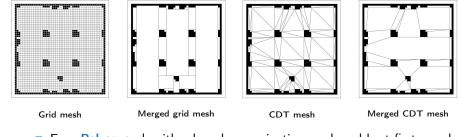

Navigation Mesh

 In addition to robotic approaches, fast shortest path queries are studied in computer games

Notation

- There is a class of algorithms based on navigation mesh
 - A supporting structure representing the free space

It usually originated from the grid based maps, but it is represented as **CDT – Constrained Delaunay triangulation**

E.g., Polyanya algorithm based on navigation mesh and best-first search M. Cui, D. Harabor, A. Grastien: Compromise-free Pathfinding on a Navigation Mesh, IJCAI 2017, 496-502. https://bitbucket.org/dharabor/pathfinding
