# Path and Motion Planning

Jan Faigl

Department of Computer Science Faculty of Electrical Engineering Czech Technical University in Prague

Lecture 03

B4M36UIR - Artificial Intelligence in Robotics

# Overview of the Lecture

- Part 1 Path and Motion Planning
  - Introduction to Path Planning
  - Notation and Terminology
  - Path Planning Methods

A classical motion planning problem

Having a CAD model of the piano, model of the environment, the prob-

lem is how to move the piano from one place to another without hitting

We need notion of model representations and formal definition of

■ Moreover, we also need a context about the problem and realistic

# Part I

Trajectory Planning

# Robot Motion Planning – Motivational problem

■ How to transform high-level task specification (provided by humans) into a low-level description suitable for controlling the actuators?

To develop algorithms for such a transformation.

The motion planning algorithms provide transformations how to move a robot (object) considering all operational constraints.

It encompasses several disciples we gon mathematics,

B4M36UIR - Lecture 03: Path and Motion Planning

marily on rotations and translations.

Sensing and Acting

B4M36UIR - Lecture 03: Path and Motion Planning

Basic motion planning algorithms are focused pri-

The plans have to be admissible and feasible

## Real Mobile Robots

Introduction to Path Planning

lan Faigl, 2017

In a real deployment, the problem is a more complex

- The world is changing
- Robots update the knowledge about the environment

localization, mapping and navigation

- New decisions have to made
- A feedback from the environment Motion planning is a part of the mission replanning loop.

Josef Štrunc. Bachelor thesis, CTU, 2009.

An example of robotic mission:

Multi-robot exploration of unknown environment

How to deal with real-world complexity?

Relaxing constraints and considering realistic assumptions.

### Notation

assumptions.

- $\mathbf{W}$  World model describes the robot workspace and its boundary determines the obstacles  $\mathcal{O}_i$ .
  - 2D world,  $W = \mathbb{R}^2$
- A Robot is defined by its geometry, parameters (kinematics) and it is controllable by the motion plan.
- $\mathcal{C}$  Configuration space ( $\mathcal{C}$ -space)

A concept to describe possible configurations of the robot. The robot's configuration completely specify the robot location in  ${\mathcal W}$ including specification of all degrees of freedom.

E.g., a robot with rigid body in a plane  $C = \{x, y, \varphi\} = \mathbb{R}^2 \times S^1$ .

- Let  $\mathcal{A}$  be a subset of  $\mathcal{W}$  occupied by the robot,  $\mathcal{A} = \mathcal{A}(q)$ .
- lacksquare A subset of  $\mathcal C$  occupied by obstacles is

 $C_{obs} = \{ q \in C : A(q) \cap O_i, \forall i \}$ 

Collision-free configurations are

 $C_{free} = C \setminus C_{obs}$ 

Path / Motion Planning Problem

Models of robot and

workspace

- Path is a continuous mapping in C-space such that
  - $\pi: [0,1] \to \mathcal{C}_{free}$ , with  $\pi(0) = q_0$ , and  $\pi(1) = q_f$ , Only geometric considerations
- Trajectory is a path with explicate parametrization of time, e.g., accompanied by a description of the motion laws  $(\gamma : [0,1] \to \mathcal{U},$ where  $\mathcal{U}$  is robot's action space).

It includes dynamics.

$$[T_0,T_f]
i t
ightharpoonup au\in[0,1]:q(t)=\pi( au)\in\mathcal{C}_{\mathit{free}}$$

The planning problem is determination of the function  $\pi(\cdot)$ .

Additional requirements can be given:

- Smoothness of the path
- Kinodynamic constraints
- E.g., considering friction forces

B4M36UIR - Lecture 03: Path and Motion Planning

Optimality criterion

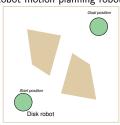

shortest vs fastest (length vs curvature)

Jan Faigl, 2017

Example of  $C_{obs}$  for a Robot with Rotation

# Planning in C-space

Robot motion planning robot for a disk robot with a radius  $\rho$ .

Motion planning problem in geometrical representation of W

Planning Methods - Overview

■ Roadmap based methods

■ Cell decomposition

■ Visibility graph

■ Voronoi graph

Motion planning problem in C-space representation

 $\mathcal{C} ext{-space}$  has been obtained by enlarging obstacles by the disk  $\mathcal{A}$ with the radius  $\rho$ .

■ Discretization into a grid-based (or lattice-based) representation

■ Potential field methods (complete only for a "navigation function", which is hard to compute in general)

 $\blacksquare$  Creates a roadmap from connected random samples in  $\mathcal{C}_{free}$ 

By applying Minkowski sum:  $\mathcal{O} \oplus \mathcal{A} = \{x + y \mid x \in \mathcal{O}, y \in \mathcal{A}\}.$

Jan Faigl, 2017

B4M36UIR - Lecture 03: Path and Motion Planning

A simple 2D obstacle  $\rightarrow$  has a complicated  $C_{obs}$ 

Requires exponential time in C dimension,

J. Canny, PAMI, 8(2):200-209, 1986

13 / 29

Path Planning Methods

(selected approaches)

Create a connectivity graph of the free space.

(complete but impractical)

Classic path planning algorithms

samples are drawn from some distribution

Path Planning Methods

Visibility Graph

1. Compute visibility graph 2. Find the shortest path

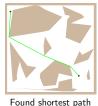

Deterministic algorithms exist

Problem

Visibility graph

E.g., by Dijkstra's algorithm

Constructions of the visibility graph:

■ Naïve – all segments between n vertices of the map  $O(n^3)$ 

lacktriangle Explicit representation of  $\mathcal{C}_{free}$  is impractical to compute.

Using rotation trees for a set of segments –  $O(n^2)$ 

M. H. Overmars and E. Welzl. 1988

B4M36UIR - Lecture 03: Path and Motion Planning

Jan Faigl, 2017

# 17 / 29

### B4M36UIR - Lecture 03: Path and Motion Planning

Speedup computation of the shortest path towards a particular

goal location  $p_g$  for a polygonal domain  $\mathcal{P}$  with n vertices

A partitioning of the free space into cells with

**Each** cell has a vertex on the shortest path to  $p_{\sigma}$ 

■ Shortest path from any point p is found by deter-

mining the cell (in  $O(\log n)$  using point location

alg.) and then travesing the shortest path with

up to k bends, i.e., it is found in  $O(\log n + k)$ 

■ Determining the SPM using "wavefront" propa-

gation based on continuous Dijkstra paradigm

■ SPM is a precompute structure for the given  $\mathcal{P}$  and  $p_{\sigma}$ 

respect to the particular location  $p_{\sigma}$ 

B4M36UIR - Lecture 03: Path and Motion Planning Path Planning Methods

16 / 29

Path Planning Methods

Shortest Path Map (SPM)

# Visibility Graph vs Voronoi Graph

Probabilistic roadmaps

■ Very successful in practice

Randomized sampling-based methods

Visibility graph

- Shortest path, but it is close to obstacles. We have to consider safety of the path
  - lead to a collision.

- It maximize clearance, which can provide conservative paths
- Small changes in obstacles can lead to large changes in the graph
- Complicated in higher dimensions

A combination is called Visibility-Voronoi - R. Wein. J. P. van den Berg, D. Halperin, 2004

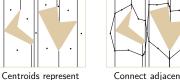

For higher dimensions we need other roadmaps. B4M36UIR - Lecture 03: Path and Motion Planning

Other decomposition (e.g., triangulation) are possible.

# Cell Decomposition

- 1. Decompose free space into parts.
  - Any two points in a convex region can be directly connected by a segment
- 2. Create an adjacency graph representing the connectivity of the free space.
- 3. Find a path in the graph.

## Trapezoidal decomposition

Connect adjacency cells

Find path in the adjacency graph

single-point query A similar structure can be found for two-point query, e.g., H. Guo, A. Maheshwari, J.-R. Sack, 2008

Joseph S. B. Mitchell: A new algorithm for shortest paths among obstacles in the plane, Annals of Mathematics and Artificial Intelligence, 3(1):83–105, 1991.

How to deal with continuous representation of C-space?

Representation of C-space

Continuous Representation of C-space

Discretization

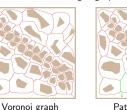

processing critical geometric events, (random) sampling roadmaps, cell decomposition, potential field

> Graph Search Techniques BFS. Gradient Search. A\*

B4M36UIR - Lecture 03: Path and Motion Planning

Voronoi Graph

- 1. Roadmap is Voronoi graph that maximizes clearance from the obstacles
  - 2. Start and goal positions are connected to the graph
  - 3. Path is found using a graph search algorithm

Path in graph

■ We can use any convex partitioning of the polygonal map to speed

■ Precompute all shortest paths from map vertices to  $p_{\varepsilon}$  using

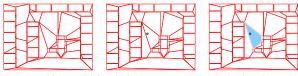

■ Then, an estimation of the shortest path from p to  $p_g$  is the

Approximate Shortest Path and Navigation Mesh

shortest path among the one of the cell vertex

## Point Location Problem

■ For a given partitioning of the polygonal domain into a discrete set of cells, determine the cell for a given point p

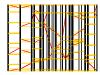

Masato Edahiro, Iwao Kokubo and Takao Asano: A new point-location algorithm and its practica

■ It can be implemented using interval trees – slabs and slices

studied in computer games

B4M36UIR - Lecture 03: Path and Motion Planning 22 / 29

■ In addition to robotic approaches, fast shortest path queries are

as CDT - Constrained Delaunay triangulation

■ There is a class of algorithms based on navigation mesh

A supporting structure representing the free space

Path Planning Methods

Path Planning Methods

23 / 29

# Artificial Potential Field Method

up shortest path queries

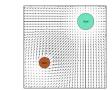

visibility graph

 $\blacksquare$  The idea is to create a function f that will provide a direction towards the goal for any configuration of the robot.

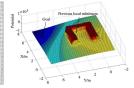

■ The estimation can be further improve by "ray-shooting" technique combined with walking in triangulation (convex partitioning)

- Such a function is called navigation function and  $-\nabla f(q)$  points to
- $\blacksquare$  Create a potential field that will attract robot towards the goal  $q_f$ while obstacles will generate repulsive potential repelling the robot away from the obstacles.

The navigation function is a sum of potentials.

Such a potential function can have several local minima. B4M36UIR - Lecture 03: Path and Motion Planning

M. Cui, D. Harabor, A. Grastien: Compromise-free Pathfinding on a Navigation Mesh,

■ E.g., Polyanya algorithm based on navigation mesh and best-first search

Jan Faigl, 2017

Navigation Mesh

B4M36UIR - Lecture 03: Path and Motion Planning

It usually originated from the grid based maps, but it is represented

Merged CDT mesh

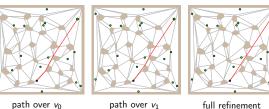

Jan Faigl, 2017

# Topics Discussed

- Motion planning problem
- Path planning methods overview
- Notation of configuration space
- Shortest-Path Roadmaps
- Voronoi diagram based planning
- Cell decomposition method
- Artificial potential field method
- Next: Grid-based path planning

## Path Refinement

- Testing collision of the point p with particular vertices of the estimation of the shortest path
  - Let the initial path estimation from p to  $p_{\sigma}$  be a sequence of kvertices  $(p, v_1, \ldots, v_k, p_g)$
  - We can iteratively test if the segment  $(p, v_i)$ ,  $1 < i \le k$  is collision free up to  $(p, p_g)$

With precomputed structures, it allows to estimate the shortest path in units of microseconds

# Avoiding Local Minima in Artificial Potential Field

Consider harmonic functions that have only one extremum

$$\nabla^2 f(q) = 0$$

Finite element method

Dirichlet and Neumann boundary conditions

J. Mačák, Master thesis, CTU, 2009
