Deep Learning

Autonomous Robotics Lab

Contact: salanvoj@fel.cvut.cz

Timeline

- Where we will do it
- How we will do it
- What we will do

Before we start

- There are two GPU servers for students

  cantor.felk.cvut.cz

  taylor.felk.cvut.cz

- You can access them using ssh command

GPU servers

- Important command: “nvidia-smi” – shows actual load on GPUs

```

```

GPU servers

- Always choose the card with enough memory with command:

  export CUDA_VISIBLE_DEVICES=X

  where X is the number of selected card

Working environment on GPU servers or class desktops (first time)

- Load singularity image

  singularity shell /opt/ros-kinetic-desktop-full.simg

- Create virtual environment

  virtualenv –system-site-packages torchenv

- Activate virtualenv

  source torchenv/bin/activate

- Install libraries to virtualenv

  pip install torch torchvision sklearn

Working environment on GPU servers or class desktops (every time)

- Load singularity image

  singularity shell /opt/ros-kinetic-desktop-full.simg

- Source ROS

  source /opt/ros/kinetic/setup.bash

- Activate virtual environment

  source torchenv/bin/activate

PyTorch

Tensors

Tensors are similar to NumPy's ndarrays, with the addition being that Tensors can also be used on a GPU to accelerate computing.

```
x = torch.tensor([5.5, 3])
print(x)
```

PyTorch

From numpy to tensor

```
nparr = np.array([5.5, 3])
x = torch.from_numpy(nparr)
```

From tensor to numpy

```
nparr = x.numpy()
```

PyTorch

Computation graph

a = torch.tensor(1)

b = torch.tensor(3.)

c = a + b or c = torch.add(a, b)

c = a * b or c = torch.mul(a, b)

PyTorch

Tensors has attribute .requires_grad

-> if it is set to True pytorch tracks all operations on this tensor

```
x = torch.rand(2, 2, requires_grad=True)
```

-> then we can use backward() function to compute gradients

Linear regressor

```
import numpy as np                                  # Imports
import torch

X = np.random.rand(30, 1)*2.0                       # Create data as numpy arrays
w = np.random.rand(2, 1)                            # Randomly select weights of linear regressor
y = X*w[0] + w[1] + np.random.randn(30, 1) * 0.05   # Create targets
print('target w {} b {}'.format(w[0], w[1]))
Xt = torch.from_numpy(X).float()                    # Convert numpy arrays to torch tensors
yt = torch.from_numpy(y).float()
W = torch.rand(1, requires_grad=True)               # Initialize weights randomly with parameter requires_grad=True
b = torch.rand(1, requires_grad=True)

lr = 0.005                                          # set up learning rate
for epoch in range(2500):
    y_pred = torch.add(torch.mul(W,Xt), b)  # W*x + b   # Compute predictions
    loss = torch.mean((y_pred - yt) ** 2)               # Compute cost function
    loss.backward()                                     # Run back-propagation
    W.data = W.data - lr*W.grad.data                    # Update parameters
    b.data = b.data - lr*b.grad.data
    W.grad.data.zero_()                                 # Reset gradients
    b.grad.data.zero_()

print('found w {} b {}'.format(W.data ,b.data))
```

Linear regressor

Model with parameters

```
import numpy as np                                  # Imports
import torch

X = np.random.rand(30, 1)*2.0                       # Create data as numpy arrays
w = np.random.rand(2, 1)                            # Randomly select weights of linear regressor
y = X*w[0] + w[1] + np.random.randn(30, 1) * 0.05   # Create targets
print('target w {} b {}'.format(w[0], w[1]))
Xt = torch.from_numpy(X).float()                    # Convert numpy arrays to torch tensors
yt = torch.from_numpy(y).float()
W = torch.rand(1, requires_grad=True)               # Initialize weights randomly with parameter requires_grad=True
b = torch.rand(1, requires_grad=True)

lr = 0.005                                          # set up learning rate
for epoch in range(2500):
    y_pred = torch.add(torch.mul(W,Xt), b)  # W*x + b   # Compute predictions
    loss = torch.mean((y_pred - yt) ** 2)           # Compute cost function
    loss.backward()                                 # Run back-propagation
    W.data = W.data - lr*W.grad.data                # Update parameters
    b.data = b.data - lr*b.grad.data
    W.grad.data.zero_()                             # Reset gradients
    b.grad.data.zero_()

print('found w {} b {}'.format(W.data ,b.data))
```

Linear regressor

Loss computation

```
import numpy as np                                  # Imports
import torch

X = np.random.rand(30, 1)*2.0                       # Create data as numpy arrays
w = np.random.rand(2, 1)                            # Randomly select weights of linear regressor
y = X*w[0] + w[1] + np.random.randn(30, 1) * 0.05   # Create targets
print('target w {} b {}'.format(w[0], w[1]))
Xt = torch.from_numpy(X).float()                    # Convert numpy arrays to torch tensors
yt = torch.from_numpy(y).float()
W = torch.rand(1, requires_grad=True)               # Initialize weights randomly with parameter requires_grad=True
b = torch.rand(1, requires_grad=True)

lr = 0.005                                          # set up learning rate
for epoch in range(2500):
    y_pred = torch.add(torch.mul(W,Xt), b)  # W*x + b   # Compute predictions
    loss = torch.mean((y_pred - yt) ** 2)           # Compute cost function
    loss.backward()                                 # Run back-propagation
    W.data = W.data - lr*W.grad.data                # Update parameters
    b.data = b.data - lr*b.grad.data
    W.grad.data.zero_()                             # Reset gradients
    b.grad.data.zero_()

print('found w {} b {}'.format(W.data ,b.data))
```

Linear regressor

Backward pass (gradient computation)

```
import numpy as np                                  # Imports
import torch

X = np.random.rand(30, 1)*2.0                       # Create data as numpy arrays
w = np.random.rand(2, 1)                            # Randomly select weights of linear regressor
y = X*w[0] + w[1] + np.random.randn(30, 1) * 0.05   # Create targets
print('target w {} b {}'.format(w[0], w[1]))
Xt = torch.from_numpy(X).float()                    # Convert numpy arrays to torch tensors
yt = torch.from_numpy(y).float()
W = torch.rand(1, requires_grad=True)               # Initialize weights randomly with parameter requires_grad=True
b = torch.rand(1, requires_grad=True)

lr = 0.005                                          # set up learning rate
for epoch in range(2500):
    y_pred = torch.add(torch.mul(W,Xt), b)  # W*x + b   # Compute predictions
    loss = torch.mean((y_pred - yt) ** 2)           # Compute cost function
    loss.backward()                                 # Run back-propagation
    W.data = W.data - lr*W.grad.data                # Update parameters
    b.data = b.data - lr*b.grad.data
    W.grad.data.zero_()                             # Reset gradients
    b.grad.data.zero_()

print('found w {} b {}'.format(W.data ,b.data))
```

Linear regressor

Optimization step

```
import numpy as np                                  # Imports
import torch

X = np.random.rand(30, 1)*2.0                       # Create data as numpy arrays
w = np.random.rand(2, 1)                            # Randomly select weights of linear regressor
y = X*w[0] + w[1] + np.random.randn(30, 1) * 0.05   # Create targets
print('target w {} b {}'.format(w[0], w[1]))
Xt = torch.from_numpy(X).float()                    # Convert numpy arrays to torch tensors
yt = torch.from_numpy(y).float()
W = torch.rand(1, requires_grad=True)               # Initialize weights randomly with parameter requires_grad=True
b = torch.rand(1, requires_grad=True)

lr = 0.005                                          # set up learning rate
for epoch in range(2500):
    y_pred = torch.add(torch.mul(W,Xt), b)  # W*x + b   # Compute predictions
    loss = torch.mean((y_pred - yt) ** 2)           # Compute cost function
    loss.backward()                                 # Run back-propagation
    W.data = W.data - lr*W.grad.data                # Update parameters
    b.data = b.data - lr*b.grad.data
    W.grad.data.zero_()                             # Reset gradients
    b.grad.data.zero_()

print('found w {} b {}'.format(W.data ,b.data))
```

Linear regressor

Optimization step

This could be replaced by optimizer

```
optimizer = torch.optim.SGD(parameters, lr, momentum, weight_decay)
optimizer.step()                                    # Update parameters
optimizer.zero_grad()                               # Reset gradients
```

```
W.data = W.data - lr*W.grad.data                    # Update parameters
b.data = b.data - lr*b.grad.data
W.grad.data.zero_()                                 # Reset gradients
b.grad.data.zero_()
```

Barbie detector

- Our goal is to implement program that will detect barbie in image and gives us a 3d coordinates of that barbie.

X, Y, Z, according to robot

Model

- We use feature extractor part of the network called YOLO V2 TINY

- We run the network on the multiple input image scales to detect barbies of all sizes

Network will find barbies size are near to 64x48 pixels

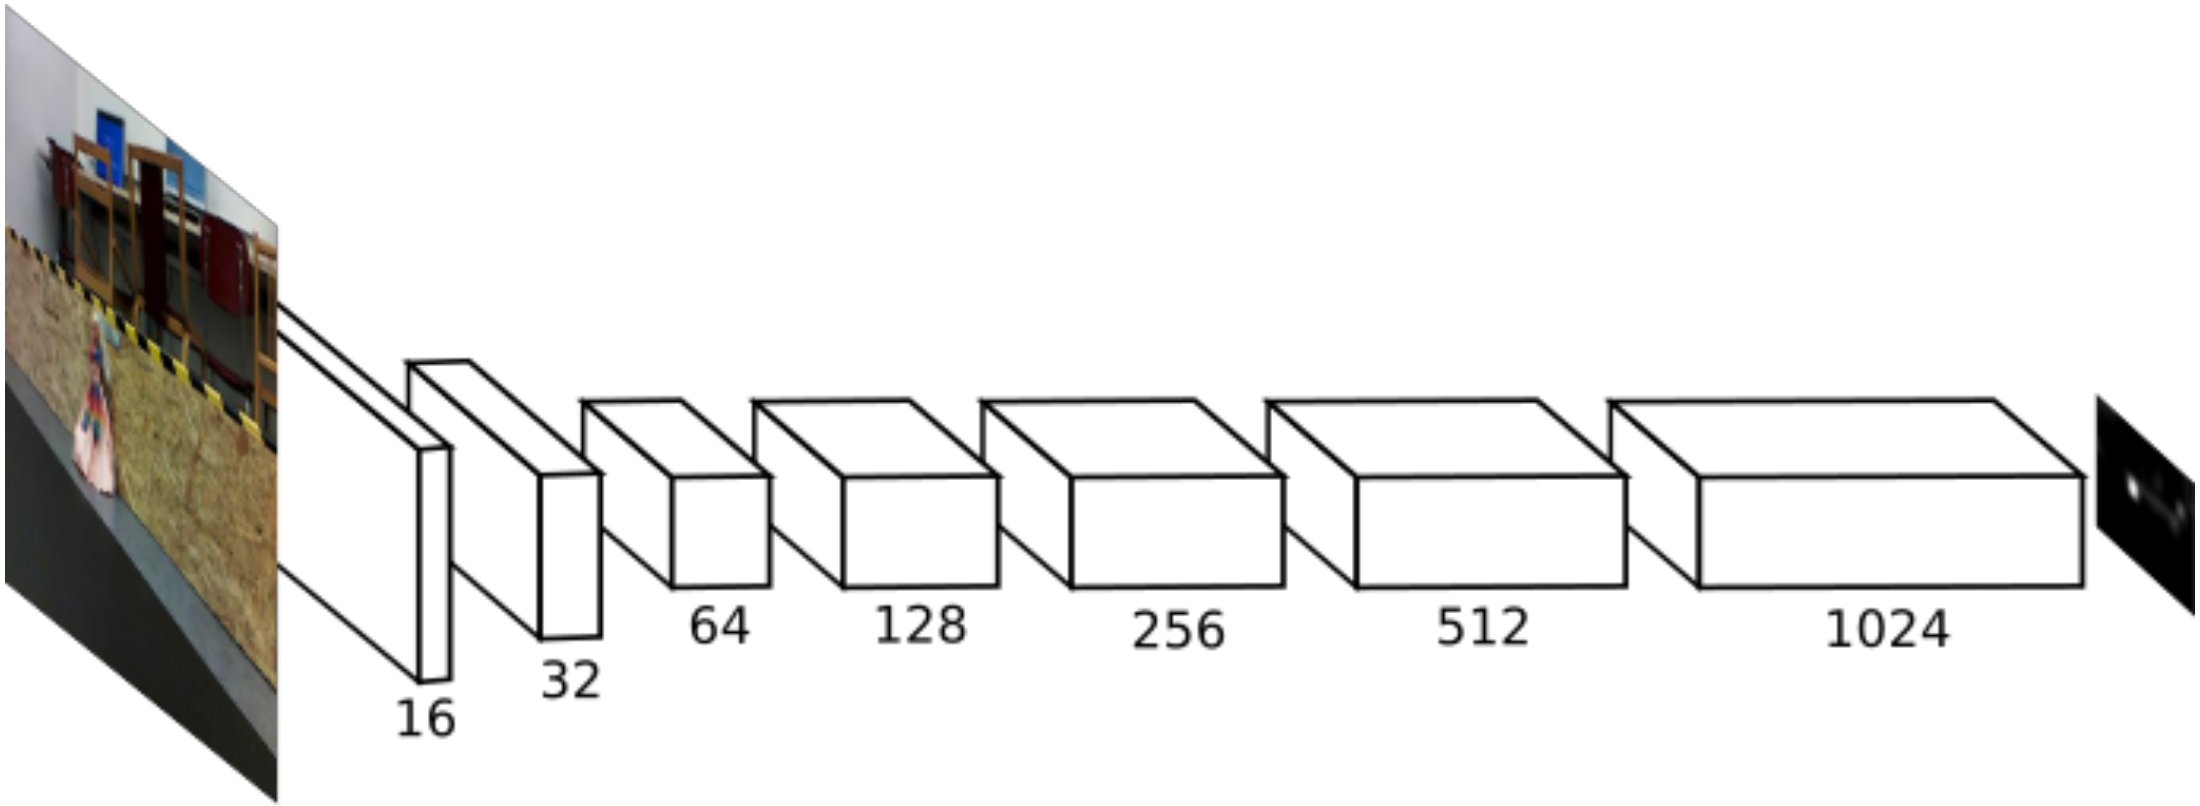
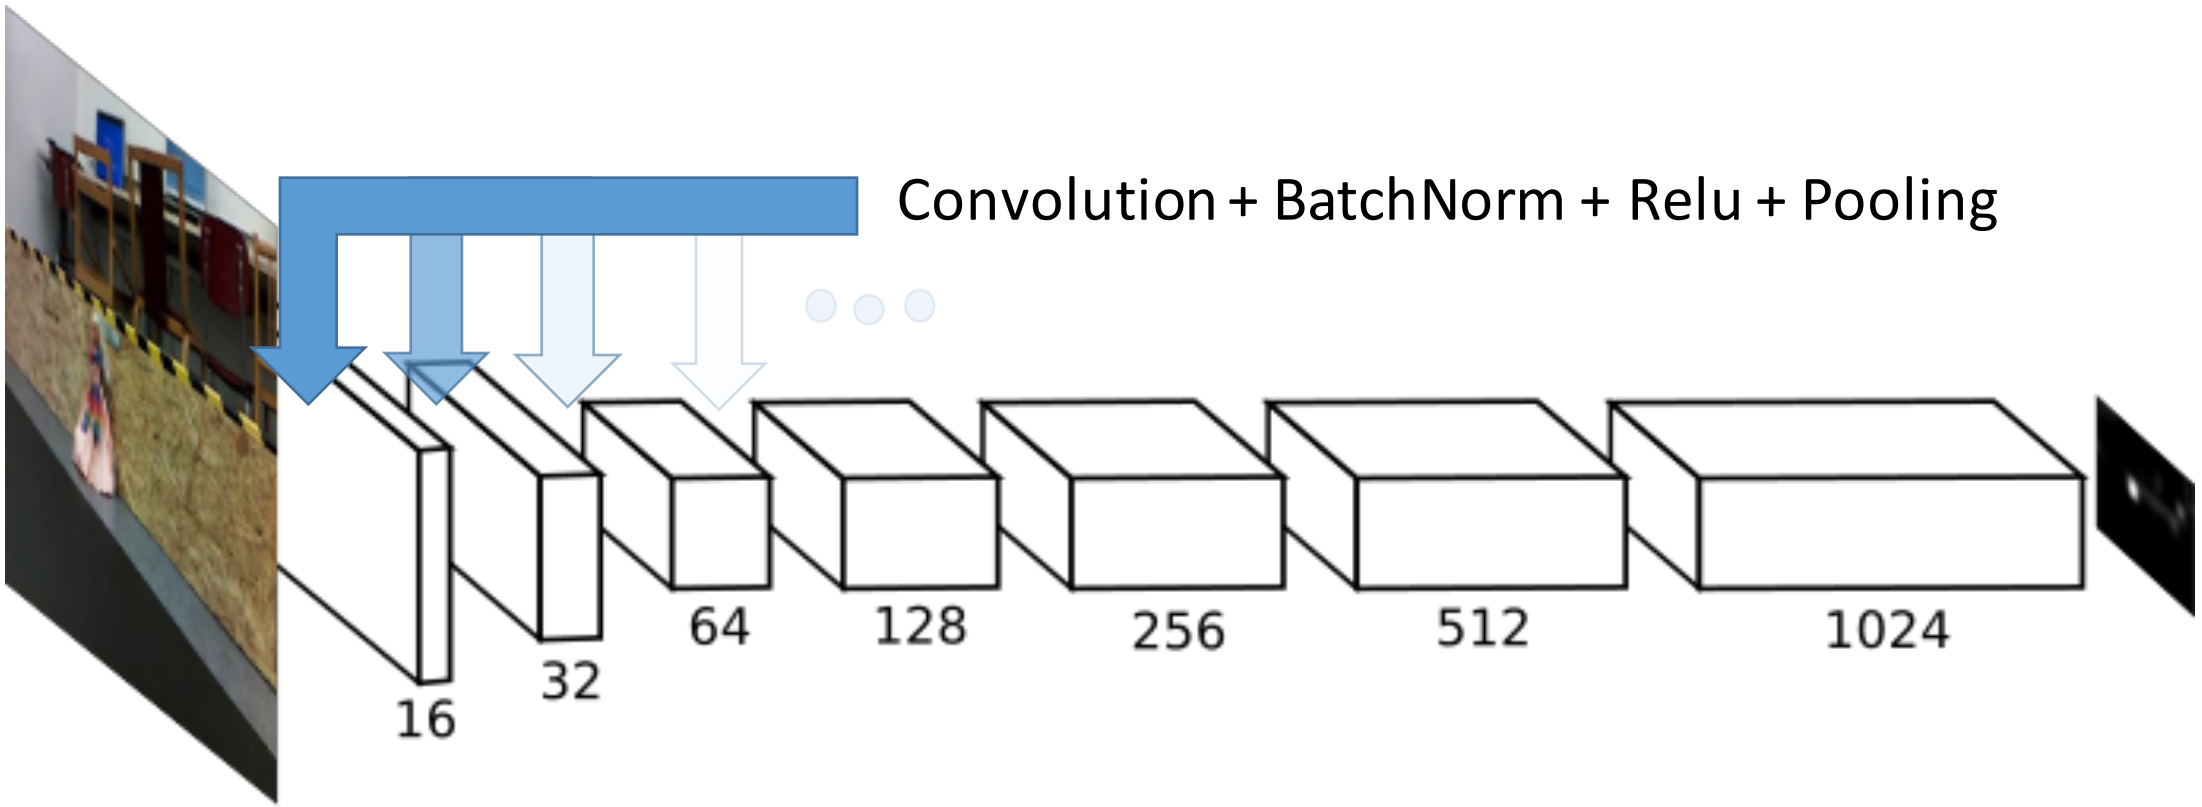
Network architecture



Network architecture



Network class

- Class Net(nn.module) has two main functions

  __init__()

    defines neural network blocks and their parameters

  forward

    defines computation graph of neural network

def __init__(self):

```
super(Net, self).__init__()
self.relu = nn.LeakyReLU(0.1, inplace=True)
self.pool1 = nn.MaxPool2d(2, 2)
self.pool2 = nn.MaxPool2d(3, 1, 1)
self.conv1 = nn.Conv2d(3, 16, 3, 1, 1, bias=False)
self.bn1 = nn.BatchNorm2d(16)
self.conv2 = nn.Conv2d(16, 32, 3, 1, 1, bias=False)
self.bn2 = nn.BatchNorm2d(32)
self.conv3 = nn.Conv2d(32, 64, 3, 1, 1, bias=False)
self.bn3 = nn.BatchNorm2d(64)
self.conv4 = nn.Conv2d(64, 128, 3, 1, 1, bias=False)
self.bn4 = nn.BatchNorm2d(128)
self.conv5 = nn.Conv2d(128, 256, 3, 1, 1, bias=False)
self.bn5 = nn.BatchNorm2d(256)
self.conv6 = nn.Conv2d(256, 512, 3, 1, 1, bias=False)
self.bn6 = nn.BatchNorm2d(512)
self.conv7 = nn.Conv2d(512, 1024, 3, 1, 1, bias=False)
self.bn7 = nn.BatchNorm2d(1024)
self.conv8 = nn.Conv2d(1024, 1, 1, 1)
```

def forward(self, input):

```
x = self.pool1(self.relu(self.bn1(self.conv1(input))))
x = self.pool1(self.relu(self.bn2(self.conv2(x))))
x = self.pool1(self.relu(self.bn3(self.conv3(x))))
x = self.pool2(self.relu(self.bn4(self.conv4(x))))
x = self.pool2(self.relu(self.bn5(self.conv5(x))))
x = self.pool2(self.relu(self.bn6(self.conv6(x))))
x = self.relu(self.bn7(self.conv7(x)))
x = (self.conv8(x))
return x
```

Training script

- Training script is prepared for you!

  You only need to set paths for training and validation data

  and set training variables properly:
  - batch_size
  - number of epochs
  - learning_rate
  - freeze_pretrained_layers

Training script

- When you lost a connection the running script will be terminated

  -> use ”screen” when running the training script

Basic Linux Screen Usage

1. On the command prompt, type **screen** .
2. Run the desired program.
3. Use the key sequence Ctrl-a + Ctrl-d to detach from the **screen** session.
4. Reattach to the **screen** session by typing **screen** -r .

HOMEWORK

- Train the network:
  1) Fill in the Net class in network.py
  2) Train the network using the train.py
     - try different training parameters to train the network
  3) Plot roc curve using the script roc.py
     (use ssh with +X parameter to allow graphic)

DEADLINE next week! (1. 4. - 4. 4.)
