A0B17MTB – Matlab

Part #2

Miloslav Čapek

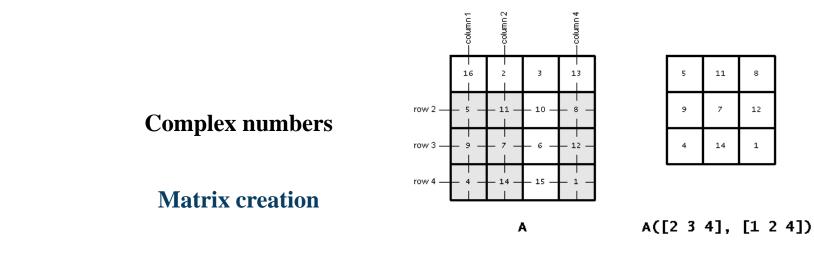

miloslav.capek@fel.cvut.cz

Filip Kozák, Viktor Adler, Pavel Valtr

Department of Electromagnetic Field B2-626, Prague

Learning how to ...

Operations with matrices

27.2.2017 14:17

A0B17MTB: Part #2

Complex numbers

- more entry options in Matlab
 - we want to avoid confusion
 - speed

>> C5 = sqrt(-1)

• frequently used functions

real, imag	real and imaginary part of a complex number
conj	complex conjugate
abs	absolute value of a complex number
angle	angle in complex plane (in [rad])
complex	constructs complex number from real and imaginary components
isreal	checks if input is a complex number (more on that later)
i, j	complex unit
cplxpair	sorts complex numbers into complex conjugate pairs

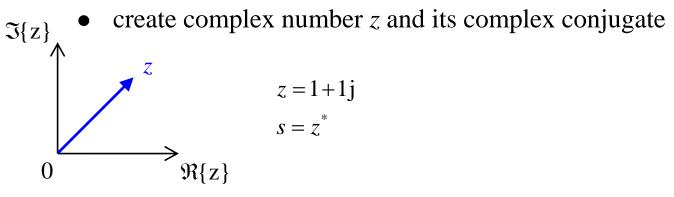

Department of Electromagnetic Field, CTU FEE, miloslav.capek@fel.cvut.cz

A0B17MTB: Part #2

27.2.2017 14:17

Complex numbers

300 s

• switch between Cartesian and polar form (find $|z|, \varphi$)

$$z = \Re\{z\} + j\Im\{z\} = a + jb$$
$$z = |z|e^{j\varphi}, |z| = \sqrt{a^2 + b^2}$$
$$z = |z|(\cos(\varphi) + j\sin(\varphi))$$

• verify Moivre's theorem

$$z^{n} = (|z|e^{j\varphi})^{n}$$
$$z^{n} = |z|^{n} (\cos(n\varphi) + j\sin(n\varphi))$$

$$Z = |z| = \sqrt{2} \approx 1.4142$$
$$\varphi = \arctan\left(\frac{\Im\{z\}}{\Re\{z\}}\right) = \arctan\left(\frac{1}{1}\right) \approx 0.7854 \,\mathrm{rad}$$

A0B17MTB: Part #2

300 s

Complex numbers

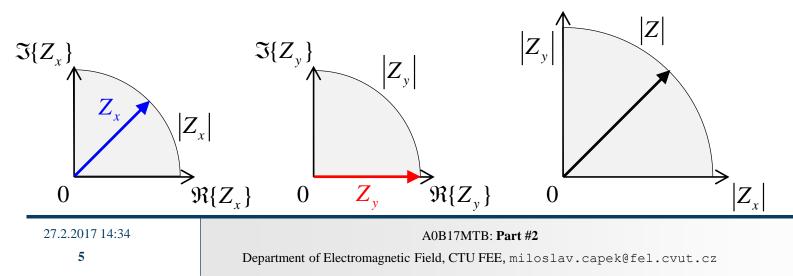

- find out magnitude of a complex vector (avoid indexing)
 - use abs, sqrt

$$\mathbf{Z} = \begin{pmatrix} 1+1j & \sqrt{2} \end{pmatrix}$$
$$\|\mathbf{Z}\| = ?, \ \mathbf{Z} \in \mathbb{C}^2$$

(1)
$$|Z_x|, |Z_y|$$

(2) $|\mathbf{Z}| = \sqrt{|Z_x|^2 + |Z_y|^2} = \sqrt{Z_x Z_x^* + Z_y Z_y^*}$
 $= \sqrt{\mathbf{Z} \cdot \mathbf{Z}^*} = \sqrt{|\mathbf{Z}|^2}$

- alternatively, use following functions:
 - norm
 - dot (*dot product*)
 - hypot (hypotenuse)

Transpose and matrix conjugate

- Pay attention to situations where the matrix is complex, $\mathbf{A} \in \mathbb{C}^{M \times N}$
- two distinct operations:

transpose	$\mathbf{A}^{\mathrm{T}} = \left[A_{ij} \right]^{\mathrm{T}} = \left[A_{ji} \right]$	transpose(A) % <- don't use	A.'
transpose + conjugate	$\mathbf{A}^{\mathrm{H}} = \mathbf{A}_{ij}^{\mathrm{H}} = \begin{bmatrix} \mathbf{A}^{*} \end{bmatrix}^{\mathrm{T}}$	ctranspose(A) % <- don't use	Α'

>> A = magic(2) + 1j*	magic(2)'	>> A.'		>> A'		
A =		ans =		ans =		
1.0000 + 1.0000i 4.0000 + 3.0000i	3.0000 + 4.0000i 2.0000 + 2.0000i		4.0000 + 3.0000i 2.0000 + 2.0000i		000 - 1.0000i 000 - 4.0000i	4.0000 - 3.0000i 2.0000 - 2.0000i

A0B17MTB: Part #2

A =

1

5

9

13

17

Entering matrices – ":"

- large vectors and matrices with regularly increasing elements can be typed in using colon operator
 - a is the smallest element ("from"), incr is increment, b is the largest element ("to")
 >> A = 1:4:17
- b doesn't have to be element of the series in question

>> A = a:incr:b

• last element $N \cdot incr$ then follows the inequality: A = 1:4:7

 $|a + N \cdot incr| \le |b|$

• if incr is ommited, the increment is set equal to 1

>> A = 0:10		>> A = a:b	
A =			
0 1 2 3	4 5	6 7 8 9 10	
27.2.2017 14:17 7	Departme	A0B17MTB: Part #2 ent of Electromagnetic Field, CTU FEE, miloslav.capek@fel.cvut.cz	

300 s

Entering matrices

- Using the colon operator ,,: " create
 - following vectors

$$\mathbf{u} = (1 \ 3 \ \dots \ 99)$$

 $\mathbf{v} = (25 \ 20 \ \dots \ -5)^{\mathrm{T}}$

• matrix

• caution, the third column cant be created using colon operator ":" only

$$\mathbf{T} = \begin{pmatrix} -4 & 1 & \frac{\pi}{2} \\ -5 & 2 & \frac{\pi}{4} \\ -6 & 3 & \frac{\pi}{6} \end{pmatrix}$$

but can be created using ":" and dot operator "." (we see in the next slides)

A0B17MTB: Part #2 Department of Electromagnetic Field, CTU FEE, miloslav.capek@fel.cvut.cz

Entering matrices – linspace, logspace

- colon operator defines vector with evenly spaced points
- In the case <u>fixed number of elements</u> of a vector is required, use linspace:

```
>> A = linspace(0,2,5)
```

```
A =
```

```
0 0.5000 1.0000 1.5000 2.0000
```

• When the N parameter is left out, 100 elements of the vector are generated:

>> A = linspace(a, b);

• the function logspace works analogically, except that logarithmic scale is used

>> A = logspace(a, b, N);

Entering matrices

200 s

• create a vector of 100 evenly spaced points in the interval <-1.15,75.4>

• create a vector of 201 evenly spaced points in the interval <100,-100>

- create a vector with spacing of -10 in the interval <100,-100>
 - try both options using linspace and colon ":"

- special types of matrices of given size are needed quite often
 - Matlab offers number of functions to serve this purpose
- example: matrix filled with zeros
 - will be used quite often

```
zeros(m) % matrix B of size m×m
zeros(m, n) % matrix B of size m×n
zeros(m, n, p,...) % matrix B of size m×n×p×...
zeros([m n]) % matrix B of size m×n
B = zeros(m, 'single') % matrix B of size m×m, of type 'single')
% see Help for other options
```

• following useful functions analogical to the zeros function are available

ones	matrix filled with ones
еуе	identity matrix
NaN, Inf	matrix filled with NaN, matrix filled with Inf
magic	matrix suitable for Matlab experiments, notice its interesting properties
rand, randn, randi	matrix filled with random numbers coming from uniform and normal distribution, matrix filled with uniformly distributed random integers
randperm	returns a vector containing a random permutation of numbers
diag	creates diagonal matrix or returns diagonal of a matrix
blkdiag	constructs block diagonal matrix from input arguments
cat	groups several matrices into one (depending on dimension)
true, false	creates a matrix of logical ones and zeros
pascal, hankel	Pascal matrix, Hankel matrix

• for further functions see Matlab → Mathematics → Elementary Math → Constants and Test Matrices

360 s

- create following matrices
 - use Matlab functions
 - begin with matrices you find easy to cope with

$$\mathbf{M}_{1} = \begin{pmatrix} \text{NaN} & \text{NaN} \\ \text{NaN} & \text{NaN} \end{pmatrix}$$
$$\mathbf{M}_{2} = \begin{pmatrix} 1 & 1 & 1 & 1 \end{pmatrix}$$
$$\mathbf{M}_{3} = \begin{pmatrix} 2 & 0 & 0 \\ 0 & 3 & 0 \\ 0 & 0 & -5 \end{pmatrix}$$
$$\mathbf{M}_{4} = \begin{pmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ 0 & 0 & 0 & 0 \end{pmatrix}$$

27.2.2017 14:17

A0B17MTB: Part #2

13

360 s

• try to create empty 3-dimensional array of type double

• can you find another option?

• empty is hidden (but public) method of all non-abstract classes in Matlab

Entering matrices

- quite often there are several options how to create given matrix
 - it is possible to use <u>output of one function as an input of another</u> function in Matlab:
- consider
 - clarity
 - simplicity
 - speed
 - convention

>> plot(diag(randn(10, 1), 1))

• e.g. band matrix with '1' on main diagonal and with '2' and '3' on secondary diagonals

>> N = 10;
>> diag(ones(N,1)) + diag(2*ones(N-1,1),1) + diag(3*ones(N-1,1),-1)

- can be sorted out using for cycle as well (see next slides), might be faster ...
- some other idea?

Dealing with sparse matrices

- Matlab provides support for working with sparse matrices
 - most of the elements of sparse matrices are zeros and it pays off to store them in a more efficient manner
- to create sparse matrix S out of a matrix A:

S = sparse(A),

• conversion of a sparse matrix to a full matrix :

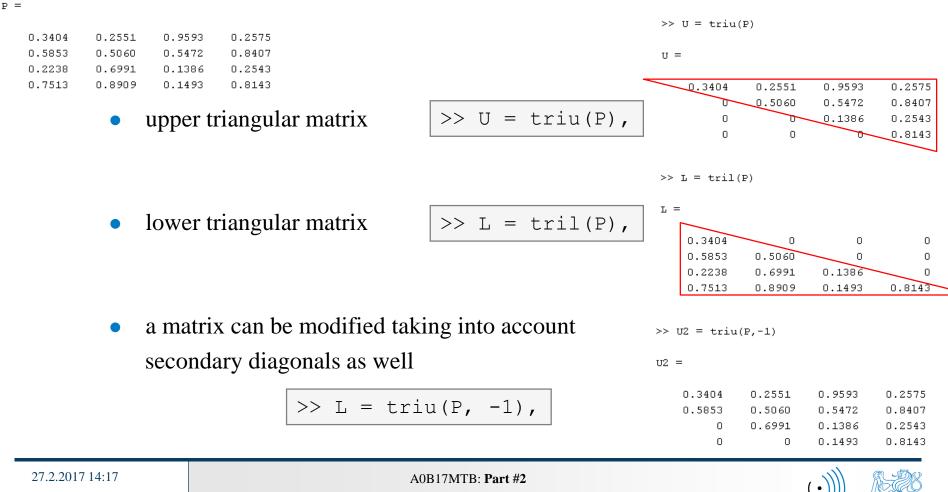

B = full(S),

• in the case of need see Help for other functions

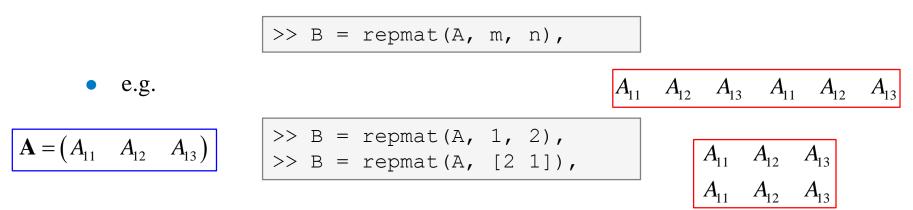

16

• there are other useful functions apart from transpose (transpose) and matrix diagonal (diag):

• function repmat is used to copy (part of) a matrix

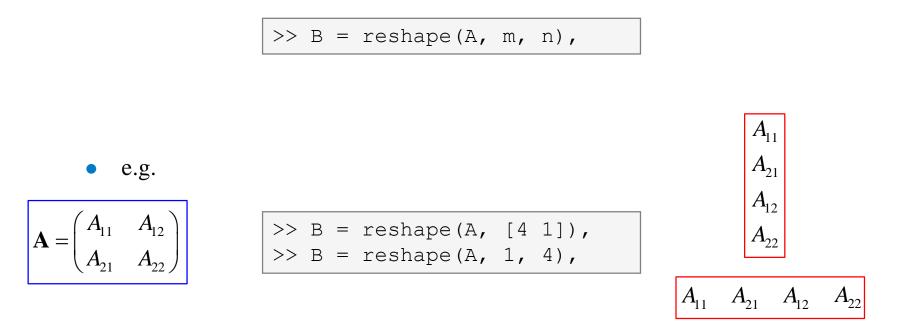

- repmat is a very fast function
 - comparison of execution time of creating a $1e4 \times 1e4$ matrix filled with zeros (HW, SW and Matlab version dependent):

>> X = zeros(1e4, 1e4);	% computed in 0.18 s
>> Y = repmat(0, 1e4, 1e4);	% computed in 0.0004s, BUT don't use it

• it is for you to consider the way of matrix allocation ...

• function reshape is used to reshuffle a matrix

27.2.2017 14:17

A0B17MTB: Part #2

19

Matrix operations #4

- following functions are used to swap the order of
 - columns: fliplr

$$\mathbf{A} = \begin{pmatrix} A_{11} & A_{12} & A_{13} \\ A_{21} & A_{22} & A_{23} \end{pmatrix}$$

• rows: flipud

$$\mathbf{A} = \begin{pmatrix} A_{13} & A_{12} & A_{11} \\ A_{23} & A_{22} & A_{21} \end{pmatrix}$$

$$\mathbf{A} = \begin{pmatrix} A_{21} & A_{22} & A_{23} \\ A_{11} & A_{12} & A_{13} \end{pmatrix}$$

• row-wise or column-wise: flip

>> B = flip(A, 1), >> B = flip(A, 2),

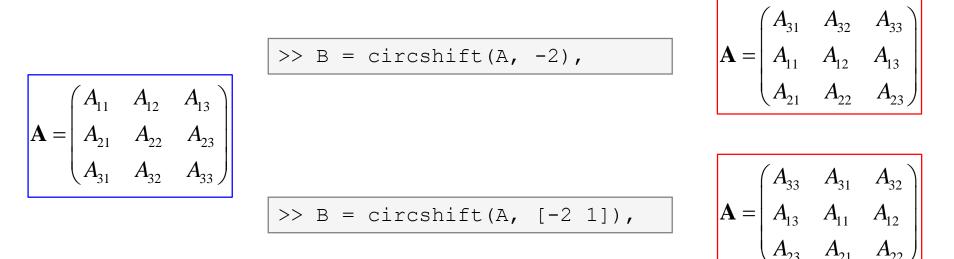

• the same result is obtained using indexing (see next slides)

A0B17MTB: Part #2

27.2.2017 14:17

- circular shift is also available
 - can be carried out in chosen dimension (row-wise/ column-wise)
 - can be carried out in both directions (back / forth)

• Consider the difference between flip a circshift

450 s

• convert the matrix $\mathbf{A} = \begin{pmatrix} 1 & \pi \\ e & -i \end{pmatrix}$ to have the form of matrices \mathbf{A}_1 to \mathbf{A}_4

• use repmat, reshape, triu, tril and conj

$$\mathbf{A}_{1} = \begin{pmatrix} 1 & \pi & 1 & \pi & 1 & \pi \\ e & -\mathbf{i} & e & -\mathbf{i} & e & -\mathbf{i} \end{pmatrix} \qquad \mathbf{A}_{2} = \begin{pmatrix} 1 & \pi & e & -\mathbf{i} \end{pmatrix} \qquad \mathbf{A}_{3} = \begin{pmatrix} 1 & \pi \\ e & +\mathbf{i} \\ 1 & \pi \\ e & +\mathbf{i} \\ 1 & \pi \\ e & +\mathbf{i} \end{pmatrix}$$

$$\mathbf{A}_{4} = \begin{pmatrix} 1 & \pi & 0 & 0 & 0 & 0 \\ e & -\mathbf{i} & e & 0 & 0 & 0 \\ 0 & \pi & 1 & \pi & 0 & 0 \\ 0 & 0 & e & -\mathbf{i} & e & 0 \\ 0 & 0 & 0 & \pi & 1 & \pi \\ 0 & 0 & 0 & 0 & e & -\mathbf{i} \end{pmatrix}$$

27.2.2017 14:17

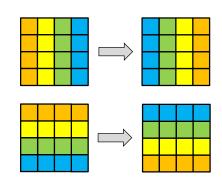

A0B17MTB: Part #2

450 s

- **Matrix operations #2**
 - create following matrix (use advanced techniques)

 $\mathbf{A} = \begin{pmatrix} 1 & 2 & 3 & 1 & 2 & 3 \\ 0 & 2 & 4 & 0 & 2 & 4 \\ 0 & 0 & 5 & 0 & 0 & 5 \end{pmatrix}$

- save the matrix in file named 'matrix.mat'
- create matrix **B** by swapping columns in matrix **A**
- create matrix **C** by swapping rows in matrix **B**
- add matrices **B** and **C** in the file 'matrix.mat'

>> x = (1:5)'

1 2

> 3 4

> > 5

x =

• compare and interpret following commands:

```
>> x = (1:5).'; % entering vector
>> X = repmat(x, [1 10]), % 1. option
>> X = x(:, ones(10, 1)), % 2. option
```

• repmat is powerful, but not always the most time-efficient function

>>	X = re	epmat(:	x,[1 10)))						
x =	:									
	1	1	1	1	1	1	1	1	1	1
	2	2	2	2	2	2	2	2	2	2
	3	3	З	З	З	3	З	3	3	3
	4	4	4	4	4	4	4	4	4	4
	5	5	5	5	5	5	5	5	5	5
>>	x = x	(:,one:	s(10,1)))						
x =	:									
	1	1	1	1	1	1	1	1	1	1
	2	2	2	2	2	2	2	2	2	2
	З	3	3	3	3	3	3	3	3	3
	4	4	4	4	4	4	4	4	4	4
	5	5	5	5	5	5	5	5	5	5

A0B17MTB: Part #2

Vector and matrix operations

- remember that matrix multiplication is not commutative, i.e. $AB \neq BA$
- remember that vector × vector product results in

• ... pay attention to the dimensions of matrices!

Element-by-element vector product

- it is possible to multiply arrays of the same size in the element-byelement manner in Matlab
 - result of the operation is an array
 - size of all arrays are the same, e.g. in the case of 1×3 vectors:

$$\mathbf{a} = \begin{pmatrix} a_1 & a_2 & a_3 \end{pmatrix} \qquad \mathbf{b} = \begin{pmatrix} b_1 & b_2 & b_3 \end{pmatrix}$$

>> a*b
$$a_1 a_2 a_3, b_1 b_2 b_3 \rightarrow \text{Error using } \star \text{(Inner matrix dimensions must agree.)}$$
>> a.*b
 $a_1 a_2 a_3, b_1 b_2 b_3 \rightarrow a_1 b_1 a_2 b_2 a_3 b_3 = [a_i b_i]$

Department of Electromagnetic Field, CTU FEE, miloslav.capek@fel.cvut.cz

A0B17MTB: Part #2

26

Element-by-element matrix product

- if element-by-element multiplication of two matrices of the same size is needed, use the '. *'operator
 - i.e. two cases of multiplication are distinguished

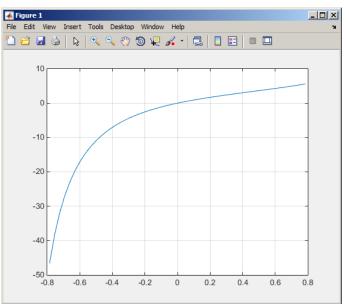

• It is so called *Hadamard product / element-wise product / Schur product*: **A** • **B**

Element-wise operations #1

- element-wise operations can be applied to vectors as well in Matlab. Element-wise operations can be usefully combined with vector functions
- it is possible, quite often, to eliminate 1 or even 2 for-loops!!!
- these operations are exceptionally efficient
 → allow the use of so called <u>vectorization</u> (see later)

• e.g.:
$$f(x) = \frac{10}{(x+1)} \tan(x)$$
,
 $x \in \left[-\frac{\pi}{4}, \frac{\pi}{4}\right]$
>> x = -pi/4:pi/100:pi/4;
>> fx = 10./(1+x).*tan(x);
>> plot(x, fx);
>> grid on;

A0B17MTB: Part #2

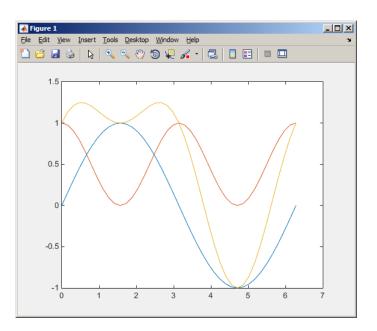

Element-wise operations #1

- 300 s
- evaluate functions $f_1(x) = \sin(x)$ of the variable $x \in [0, 2\pi]$ $f_2(x) = \cos^2(x)$ $f_3(x) = f_1(x) + f_2(x)$
 - evaluate the functions in evenly spaced points of the interval, the spacing is $\Delta x = \pi/20$

• for verification:

>> plot(x,f1, x,f2, x,f3),

• Matlab also enables symbolic solution (see later)

Department of Electromagnetic Field, CTU FEE, miloslav.capek@fel.cvut.cz

A0B17MTB: Part #2

27.2.2017 14:17

240 s

Element-wise operations #2

• depict graphically following functional dependence in the interval

 $x \in [0, 5\pi]$

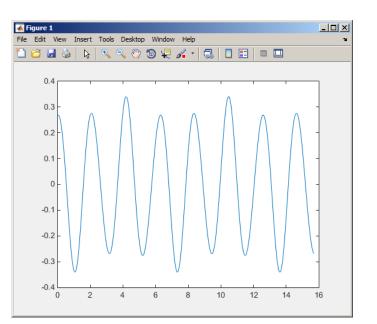

• plot the result using following function

explain the difference in the way of

>> A.*B,

multiplication of matrices of the same size

$$f_4(x) = \frac{-\cos(3x)}{\cos(x)\sin\left(x - \frac{\pi}{5}\right) - \pi}$$

27.2.2017 14:17

>> A*B,

A0B17MTB: **Part #2**

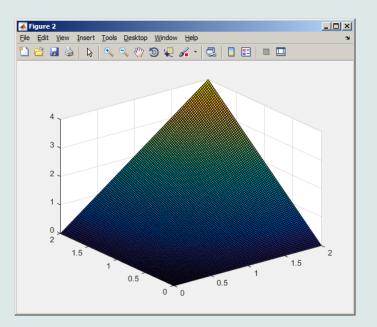

Department of Electromagnetic Field, CTU FEE, miloslav.capek@fel.cvut.cz

>> A'.*B,

Element-wise operations #3

- evaluate the function f(x, y) = xy, $x, y \in [0, 2]$, use 101 evenly spaced points in both x and y
- the evaluation can be carried out either using <u>vectors</u>, matrix elementwise <u>vectorization</u> or using two for loops
 - plot the result using surf(x, y, f)
 - when ready, try also $f(x, y) = x^{0.5}y^2$ on the same interval

or (will be useful later):

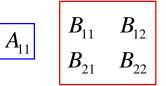

A0B17MTB: Part #2

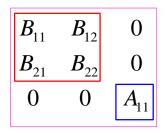

27.2.2017 14:17

Matrix operations

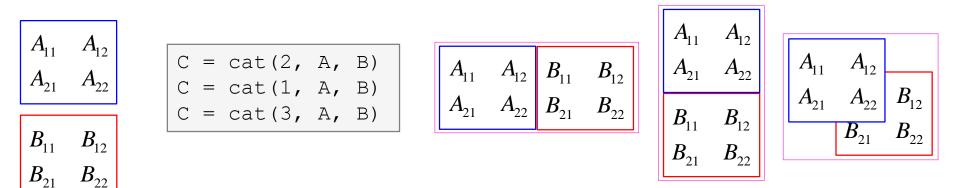

• construct block diagonal matrix: blkdiag

>> A = 1; B = [2 3; -4 -5];
>> C = blkdiag(B, A);

arranging two matrices of the same size: cat

A0B17MTB: Part #2 Department of Electromagnetic Field, CTU FEE, miloslav.capek@fel.cvut.cz

Size of matrices and other structures

- it is often needed to know size of matrices and arrays in Matlab
- function size returns a vector giving the size of the matrix / array

>> A = randn(3, 5); >> d = size(A) % **d = [3 5]**

• function length returns largest dimension of an array

>> A = randn(3, 5, 8); >> e = length(A) % e = 8

- function ndims returns number of dimensions of a matrix / array
 - i.e. ndims(A) = length(size(A))

• function numel returns number of elements of a matrix / array

>> n = numel(A) % **n = 120**

27.2.2017 14:17

Size of matrices and other structures

250 s

- create an arbitrary 3D array
 - you can make use of the following commands :

>> A = rand(2+randi(10), 3+randi(5));
>> A(:,:,2) = flipud(fliplr(A)),

- and now:
 - find out the size of A
 - find out the number of elements of A
 - find out the number of elements of A in the 'longest' dimension
 - find out the number of dimensions of A

Data types

Data types in Matlab

• can be postponed for later ...

A0B17MTB: Part #2

35

Bonus: function gallery

- function enabling to create a vast set of matrices that can be used for Matlab code testing
- most of the matrices are special-purpose
 - function gallery offers significant coding time reduction for advanced Matlab users
- see help gallery / doc gallery
- try for instance:

>> gallery('pei', 5, 4)
>> gallery('leslie', 10)
>> gallery('clement', 8)

27.2.2017 14:17

A0B17MTB: Part #2

36

Function why

- it is a must to try that one! :)
 - try help why
 - try to find out how many answers exist

Discussed functions

real, imag, cong, angle, complex	complex numbers related functions
norm, cumsum	• norm (of a matrix / vector), cummulative sum
hypot	square root of sum of squares (real / complex numbers)
linspace, logspace	vector generation - evenly spaced, linear / logarithmic scale
zeros, ones, eye, NaN, magic	create matrix
rand, randn, randi	matrix of random numbers with uniform or normal distribution, matrix of random integers
randperm	vector containing a random permutation of numbers
true, false	create matrix (logical)
pascal, hankel, gallery	special purpose matrices •
blkdiag, cat	block diagonal matrix, groups several matrices into one
diag, triu, tril,	• diagonal matrix, upper and lower triangular matrix
fliplr, flipud, circshift	element swapping, circular shift
repmat, reshape	matrix operation (replication, reshaping)
length, size, ndims, numel	length of a vector, size of a matrix, number of dim. and elements
sparse, full	sparse and full matrix operations
grid on, grid off	Turns grid of a graph on / off
figure, surf	opens new figure, 3D graph surf

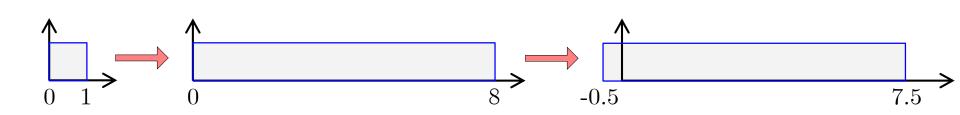

27.2.2017 14:17

A0B17MTB: Part #2 Department of Electromagnetic Field, CTU FEE, miloslav.capek@fel.cvut.cz

• create matrix **M** of size size (M) = [3 4 2] containing random numbers coming from uniform distribution on the interval [-0.5,7.5]

360 s

27.2.2017 14:17

A0B17MTB: Part #2

39

- Consider the operation a1^a2, is this operation is applicable to following cases?
 - a1 matrix, a2 scalar
 - a1 matrix, a2 matrix
 - a1 matrix, a2 vector
 - a1 scalar, a2 scalar
 - a1 scalar, a2 matrix
 - a1, a2 matrix, a1.^a2

you can always create the matrices a1, a2 and make a test ...

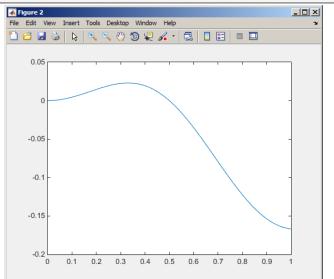

200 s

• make corrections to the following piece of code to get values of the function *f*(*x*) for 200 points on the interval [0, 1] :

$$f(x) = \frac{x^2 \cos(\pi x)}{(x^3 + 1)(x + 2)}$$

- find out the value of the function for x =1
 by direct accessing the vector
- what is the value of the function for x = 2?
- to check, plot the graph of the function f(x)

>> % erroneous code
>> x = linspace(0, 1);
>> clear;
>> g = x^3+1; H = x+2;
>> y = cos xpi; z = x.^2;
>> f = y*z/gh

41

- think over how many ways there are to calculate the length of the hypotenuse when two legs of a triangle are given
 - make use of various Matlab operators and functions
 - consider also the case where the legs are complex numbers

Exercise #5

- A proton, carrying a charge of $Q = 1.602 \cdot 10^{-19}$ C and of a mass of $m = 1.673 \cdot 10^{-31}$ kg enters a homogeneous magnetic and electric field in the direction of the *z* axis in the way that the proton follows a helical path; the initial velocity of the proton is $v_0 = 1 \cdot 10^7$ m/s. The intensity of the magnetic field is B = 0.1T, the intensity of the electric field is $E = 1 \cdot 10^5$ V/m
 - velocity of the proton along the z axis is

$$v = \frac{QE}{m}t + v_0$$

- where *t* is time, travelled distance along the *z* axis is $z = \frac{1}{2} \frac{QE}{m} t^2 + v_0 t$
- radius of the helix is $r = \frac{vm}{BQ}$
- frequency of orbiting the helix is

$$f = \frac{v}{2\pi r}$$

• the *x* and *y* coordinates of the proton are

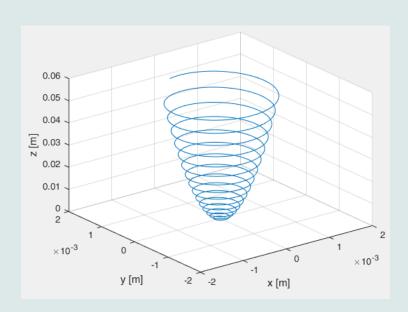

Department of Electromagnetic Field, CTU FEE, miloslav.capek@fel.cvut.cz

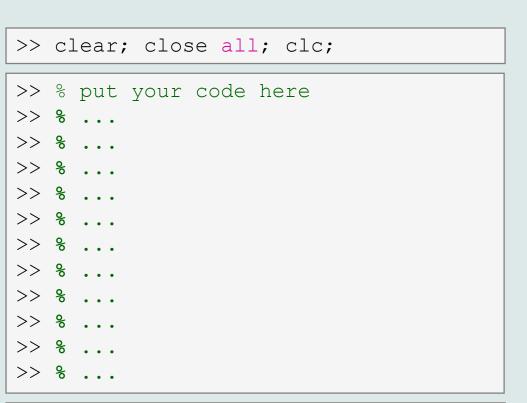

A0B17MTB: Part #2

27.2.2017 14:17

Exercise #6

 plot the path of the proton in space in the time interval from 0 ns to 1 ns in 1001 points using function comet3 (x, y, z)

>> comet3(x, y, z)

500 s

27.2.2017 14:17

A0B17MTB: Part #2

44

Thank you!
