

Problem solving by search

Tomáš Svoboda

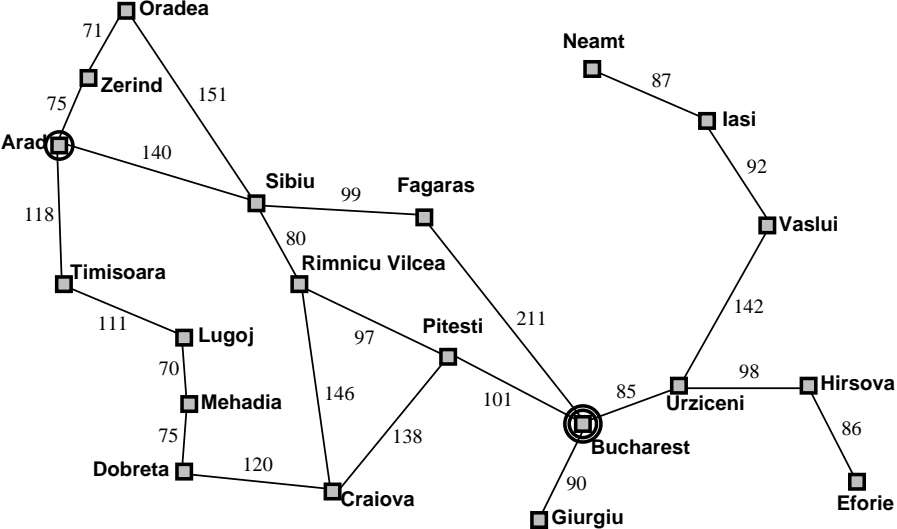

Department of Cybernetics, Vision for Robots and Autonomous Systems

February 15, 2019

Outline

- ▶ Search problem.
- ▶ State space graphs.
- ▶ Search trees.
- ▶ Strategies, which tree branches to choose?
- ▶ Strategy/Algorithm properties?
- ▶ Programming infrastructure

Example: Romania

Example: Romania

Goal:

be in Bucharest

Problem formulation:

states: position in a city (cities)

actions: drive between cities

Solution:

Sequence of cities (path)

Example: Romania

Goal:

be in Bucharest

Problem formulation:

states: position in a city (cities)

actions: drive between cities

Solution:

Sequence of cities (path)

Example: Romania

Goal:

be in Bucharest

Problem formulation:

states: position in a city (cities)

actions: drive between cities

Solution:

Sequence of cities (path)

Example: Romania

Goal:

be in Bucharest

Problem formulation:

states: position in a city (cities)

actions: drive between cities

Solution:

Sequence of cities (path)

Example: Romania

Goal:

be in Bucharest

Problem formulation:

states: position in a city (cities)

actions: drive between cities

Solution:

Sequence of cities (path)

Example: The 8-puzzle

7	2	4
5		6
8	3	1

Start State

1	2	3
4	5	6
7	8	

Goal State

states?
actions?
solution?
cost?

Example: Vacuum cleaner

states?
actions?
solution?
cost?

A Search Problem

- ▶ **State space** (including Start/Initial state): position, board configuration,
 - ▶ Actions : drive to, Up, Down, Left ...
 - ▶ Transition model : Given state and action return state (and cost)
 - ▶ Goal test : Are we done?

A Search Problem

- ▶ **State space** (including Start/Initial state): position, board configuration,
- ▶ **Actions** : drive to, Up, Down, Left ...
- ▶ Transition model : Given state and action return state (and cost)
- ▶ Goal test : Are we done?

A Search Problem

- ▶ **State space** (including Start/Initial state): position, board configuration,
- ▶ **Actions** : drive to, Up, Down, Left ...
- ▶ **Transition model** : Given state and action return state (and **cost**)
- ▶ **Goal test** : Are we done?

A Search Problem

- ▶ **State space** (including Start/Initial state): position, board configuration,
- ▶ **Actions** : drive to, Up, Down, Left ...
- ▶ **Transition model** : Given state and action return state (and **cost**)
- ▶ **Goal test** : Are we done?

State Space Graphs

State space graph: a representation of a search problem

- ▶ Graph Nodes – states – are abstracted world configurations
- ▶ Arcs represent action results
- ▶ Goal test – a set of goal nodes

Each state occurs only *once* in a state (search) space.

Search Trees

- ▶ A “what if” tree of plans and their outcomes
- ▶ Start node is the root
- ▶ Children are successors
- ▶ Nodes show states, but correspond to *plans* that achieve those states

What does the last item mean, actually?

Search Trees

- ▶ A “what if” tree of plans and their outcomes
- ▶ Start node is the root
- ▶ Children are successors
- ▶ Nodes show states, but correspond to *plans* that achieve those states

What does the last item mean, actually?

Search tree for Romania

(a) The initial state

(b) After expanding Arad

(c) After expanding Sibiu

Search elements

(c) After expanding Sibiu

- ▶ Expand **plans** - possible ways (**tree nodes**).
- ▶ Manage/Maintain **fringe** (or **frontier**) of plans under consideration.
- ▶ Expand new nodes *wisely(?)*.

Tree search algorithm

(c) After expanding Sibiu

function TREE_SEARCH(problem) **return** a solution or failure

initialize by using the initial state of the problem

loop

if no candidates for expansion then return failure

else choose a leaf node for expansion

end if

if the node contains a goal state then return the solution

end if

Expand the node and add the resulting nodes to the tree

end loop

end function

Tree search algorithm

(c) After expanding Sibiu

function TREE_SEARCH(problem) **return** a solution or failure
initialize by using the initial state of the problem

loop

if no candidates for expansion then return failure

else choose a leaf node for expansion

end if

if the node contains a goal state then return the solution

end if

Expand the node and add the resulting nodes to the tree

end loop

end function

Tree search algorithm

(c) After expanding Sibiu

function TREE_SEARCH(problem) **return** a solution or failure

initialize by using the initial state of the problem

loop

if no candidates for expansion **then return** failure

else choose a leaf node for expansion

end if

if the node contains a goal state **then return** the solution

end if

Expand the node and add the resulting nodes to the tree

end loop

end function

Tree search algorithm

(c) After expanding Sibiu

function TREE_SEARCH(problem) **return** a solution or failure

initialize by using the initial state of the problem

loop

if no candidates for expansion **then return** failure

else choose a leaf node for expansion

end if

if the node contains a goal state **then return** the solution

end if

Expand the node and add the resulting nodes to the tree

end loop

end function

Tree search algorithm

(c) After expanding Sibiu

function TREE_SEARCH(problem) **return** a solution or failure

initialize by using the initial state of the problem

loop

if no candidates for expansion **then return** failure

else choose a leaf node for expansion

end if

if the node contains a goal state **then return** the solution

end if

Expand the node and add the resulting nodes to the tree

end loop

end function

Tree search algorithm

(c) After expanding Sibiu

```
function TREE_SEARCH(problem) return a solution or failure
  initialize by using the initial state of the problem
  loop
    if no candidates for expansion then return failure
    else choose a leaf node for expansion
    end if
    if the node contains a goal state then return the solution
    end if
    Expand the node and add the resulting nodes to the tree
  end loop
end function
```

Tree search algorithm

(c) After expanding Sibiu

```
function TREE_SEARCH(problem) return a solution or failure
  initialize by using the initial state of the problem
  loop
    if no candidates for expansion then return failure
    else choose a leaf node for expansion
    end if
    if the node contains a goal state then return the solution
    end if
    Expand the node and add the resulting nodes to the tree
  end loop
end function
```

Search (algorithm) properties

- ▶ Guaranteed to find a solution (if exists)? Complete?
- ▶ Guaranteed to find the least cost path? Optimal?
- ▶ How many steps - an operation with a node? Time complexity?
- ▶ How many nodes to remember? Space/Memory complexity?

How many nodes in a tree? What are tree parameters?

DFS with limited depth, $\text{maxdepth}=2$

Do not follow nodes with $\text{depth} > \text{maxdepth}$

Iterative deepening DFS (ID-DFS)

- ▶ Start with `maxdepth = 1`
 - ▶ Perform DFS with limited depth. Report success or failure.
 - ▶ If failure, forget everything, increase `maxdepth` and repeat DFS

Is it not a terrible waste to forget everything between steps?

Iterative deepening DFS (ID-DFS)

- ▶ Start with `maxdepth = 1`
- ▶ Perform DFS with limited depth. Report success or failure.
 - ▶ If failure, forget everything, increase `maxdepth` and repeat DFS

Is it not a terrible waste to forget everything between steps?

Is it not a terrible waste to forget everything between steps?

Cost sensitive search

- ▶ In BFS, DFS, node \pm depth was the node-value.
- ▶ How was the depth actually computed?
- ▶ How to evaluate nodes with path cost?

Example: Graph with costs

Programming a Tree Search

Infrastructure for (tree) search algorithms

What should a `tree node n` now?

- ▶ `n.state`
- ▶ `n.parent`
- ▶ `n.pathcost`

Perhaps we may add something later, if needed ...

Infrastructure for (tree) search algorithms

What should a `tree node n` now?

- ▶ `n.state`
- ▶ `n.parent`
- ▶ `n.pathcost`

Perhaps we may add something later, if needed ...

How to organize nodes?

The Python examples are just suggestions, ...

- ▶ A dynamically linked structure (`list()`).
- ▶ Add a node (`list.insert(node)`).
- ▶ Take a node and remove from the structure (`node=list.pop()`).
- ▶ Check the Python modules `heapq`¹ and `queue`² for inspiration.

¹<https://docs.python.org/3.5/library/heapq.html>

²<https://docs.python.org/3.5/library/queue.html>

What is the solution?

- ▶ We stop when **Goal** is reached.
- ▶ How do we construct the **path**?
