# Finger Print History, Registration, Enhancement, and Minutias Detection I

Daniel Novák , 25.10. 2016, Prague

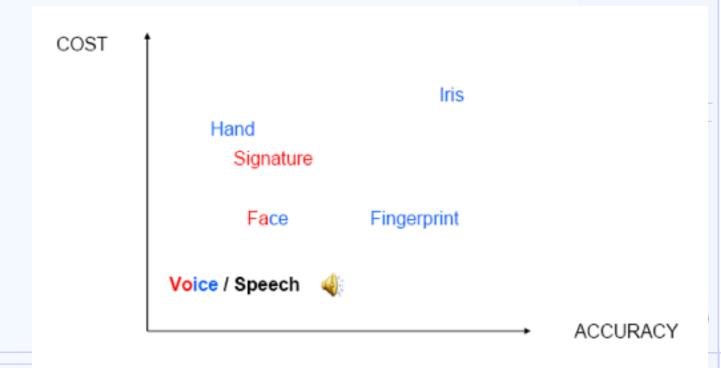

Acknowledgments: Xavier Palathingal, Andrzej Drygajlo, Handbook of Fingerprint Recognition

#### **Outline**

- Introduction to Fingerprint
- History
- Registration
- Enhancement
- Minutiaes detection

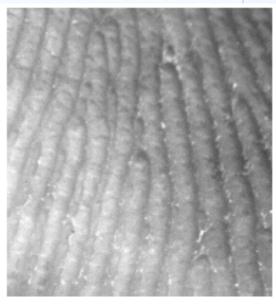

# **Fingerprint**

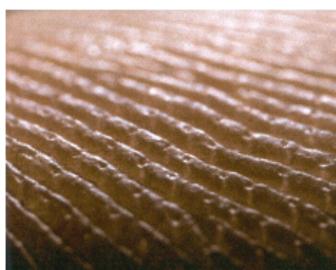

- Fingerprints are "permanent" in that they are formed in the fetal stage, prior to birth, and remain the same throughout lifetime
- The changes can be made by: flexibility from the skin, growing, a dirty finger, scarring, a wound, or a disease of the skin
- They are only weakly determined by genetics, e.g. identical (monozygotic, one egg) twins (the same DNA) have fingerprints that are quite different
- Fingerprints of an individual are "unique"; they indeed are distinctive to a person
- The right definition of a fingerprint is strictly speaking the print (stamp) that a finger left on an object

# **Fingerprint**

- The inside surfaces of hands and feet of humans (and, in fact, all primates) contain minute ridges of skin with furrows between each ridge
- The purpose of this skin structure is to:
  - Facilitate exudation of perspiration
  - Enhance sense of touch
  - Providing a gripping surface

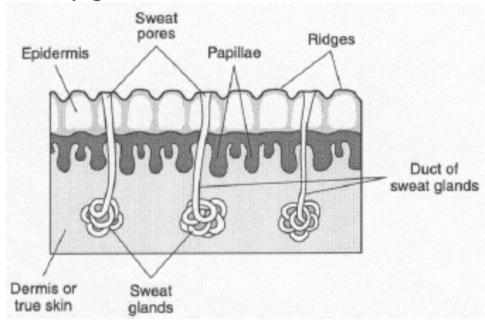

# No fingerprint?

- In very rare cases there are people that do not have prints. Not on their fingers, their palms or their feet. They where born with it or the friction ridges have degenerated during their live
- Approximately 4%
   of fingerprint images
   have been observed
   to have poor ridge
   details

#### **Friction Skin**

- Friction skin differs significantly in structure and function from the skin covering the rest of the body:
  - It is hairless
  - It contains no sebaceous (oil) glands
  - It has a much higher concentration of nerve endings
  - It has a much higher concentration of sweat glands
  - There is a lack of pigmentation

# **History of fingerprints**

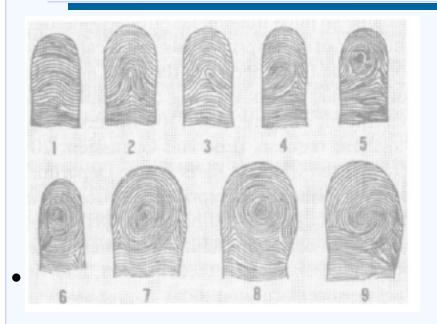

- Human fingerprints have been discovered on a large number of archaeological artifacts and historical items
- In 1684, the English plant morphologist, Nehemiah Grew, published the first scientific paper reporting his systematic study on the ridge, furrow, and pore structure
- In 1788, a detailed description of the anatomical formations of fingerprints was made by Mayer.
- In 1823, Purkinji proposed the first fingerprint classification, which classified into nine categories
- Sir Francis Galton introduced the minutae features for fingerprint matching in late 19<sup>th</sup> century
- 1924, an act of U.S. Congress established the Identification Division of the FBI (Federal Bureau of Investigation) with a database of 810 000 fingerprint cards. TODAY: 200 mil !!!

# Fingerprints as evidence

- 1892–Juan Vucetich(Argentina) made the first criminal fingerprint identification
- 1914 –Edmond Locard wrote that if 12 points(Galton's details) were the same between two fingerprints, it would suffice as a positive identification.

# **History of fingerprints**

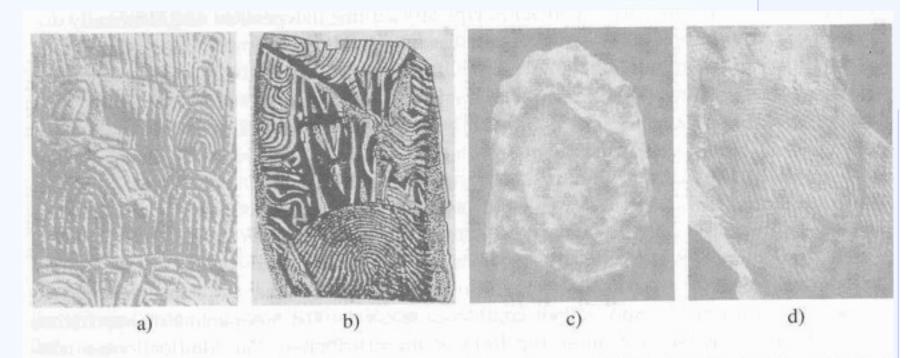

Figure 1.8. Examples of archaeological fingerprint carvings and historic fingerprint impressions a) Neolithic carvings (Gavrinis Island) (Moenssens, 1971); b) standing stone (Goat Island, 2000 B.C.) (Lee and Gaensslen, 2001); c) a Chinese clay seal (300 B.C.) (Lee and Gaensslen 2001); d) an impression on a Palestinian lamp (400 A.D.) (Moenssens, 1971). Although impressions on the Neolithic carvings and the Goat Island standing stones might not be used to indicate identity, there is sufficient evidence to suggest that the Chinese clay seal and impressions on the Palestinian lamp were used to indicate the identity of the providers. Figures courtesy of A. Moenssens, R. Gaensslen, and J. Berry.

# **Formation of fingerprints**

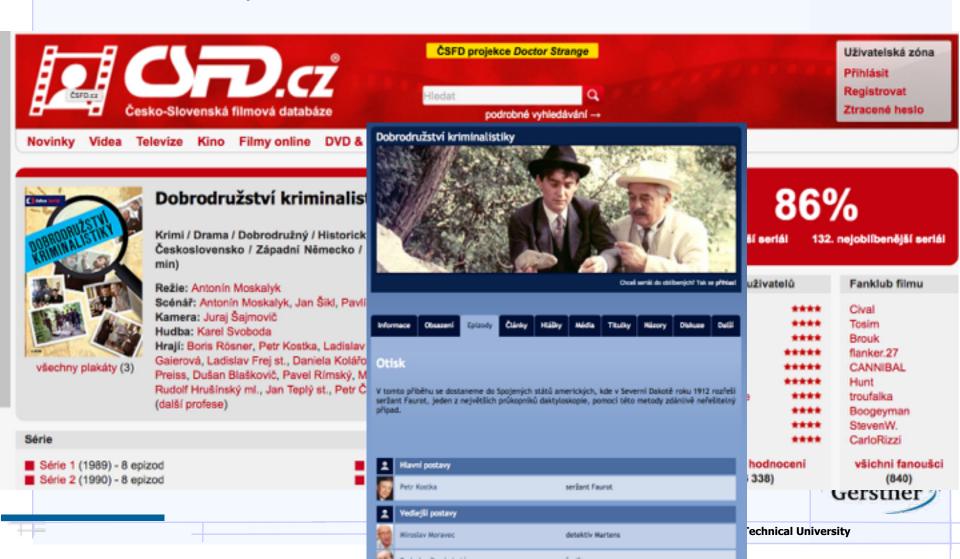

- Fingerprints are fully formed at about seven months of fetus development
- General characteristics of the fingerprint emerge as the skin on the fingertip begins to differentiate.
- flow of amniotic fluids around the fetus and its position in the uterus change during the differentiation process
  - Thus the cells on the fingertip grow in a microenvironment that is slightly different from hand to hand and finger to finger

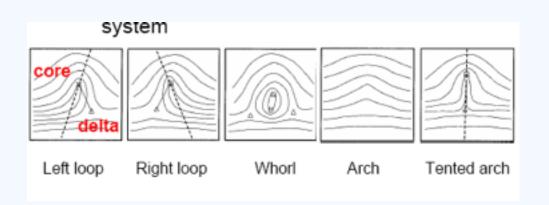

# Dobroduzství kriminalistiky

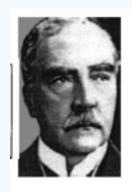

detektiv Joseph Faurout v USA , 1911

# Fingerprint feature extraction

- Fingerprint pattern, when analyzed at different scales, exhibits different types of features
  - global level delineates a ridge line flow patternSir Edward Henry 1897
  - local level minute details can be identified
  - Very fine level intra-ridge details can be detected

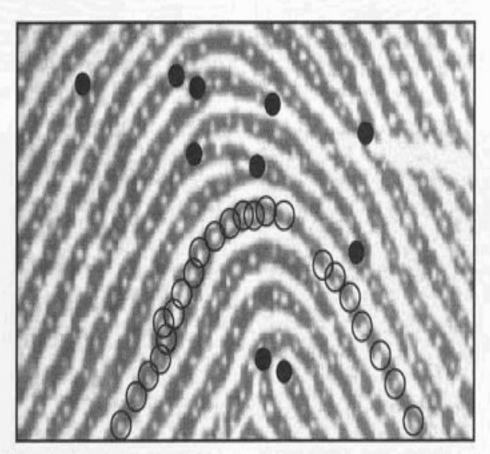

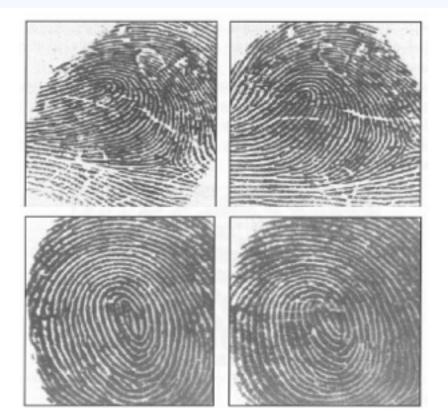

Figure 1.13. Minutiae (black-filled circles) in a portion of fingerprint image; sweat pores (empty circles) on a single ridge line.

# Difficulty in fingerprint matching

- Fingerprint matching is a difficult problem due to large variability in different impressions of the same finger
- Main factors responsible for intra-class variations are: displacement, rotation, partial overlap, non-linear distortion, variable pressure, skin condition, noise and feature extraction errors

Two impressions from the same finger

Two impressions from different fingers

### **Fingerprint classification and Indexing**

- To reduce the search time and computational complexity
- technique used to assign a fingerprint to one of the several prespecified types
- Only a limited number of categories have been identified, and there are many ambiguous fingerprints

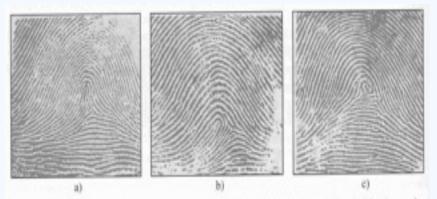

Figure 1.15. Examples of fingerprints that are difficult to classify; a) tented arch; b) a loop; c) a whort: it seems that all the fingerprints shown here should be in the loop category.

### **Synthetic fingerprints**

- Performance evaluation of fingerprint recognition systems is very data dependent
- To obtain tight confidence intervals at very low error rates, large databases of images are required and its expensive
- To solve this problem synthetic fingerprint images are introduced, cost reduction

#### The main parameters characterizing a fingerprint image are

# Resolution ,Area,Number of pixels, Dynamic Range, Geometric Accuracy, Image Quality

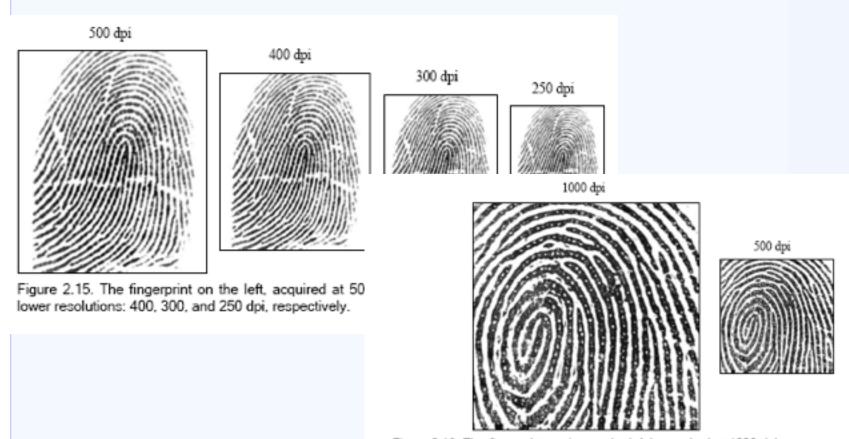

Figure 2.16. The fingerprint portion on the left is acquired at 1000 dpi; sweat pores and other fine details are clearly visible; on the right, the fingerprint portion is sub-sampled at 500 dpi while the fine details are not as clear.

# **Fingerprint images**

Optical scanner

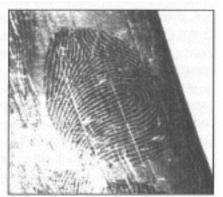

Capacitive scanner Piezoelectric scanner

Thermal scanner

Inked impression

Latent fingerprint

#### **Off-line & On-line fingerprint Acquisition**

 Although the first fingerprint scanners were introduced more than 30 years ago, still ink-technique is used in some applications

Why & What are the advantages?

Because it has the possibility of producing

Rolled impressions

http://crime.about.com/od/police/ss/fingerprints.htm

Latent impressions

The most important part of a fingerprint scanner is the sensor.

All the existing scanners belong to one of the 3 families

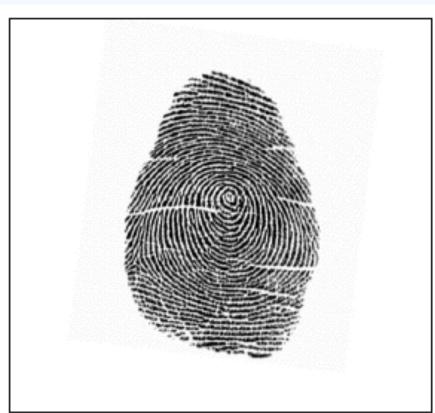

Optical sensors
Solid state sensors
Ultrasound sensors

# **Rolled & Plain FP**

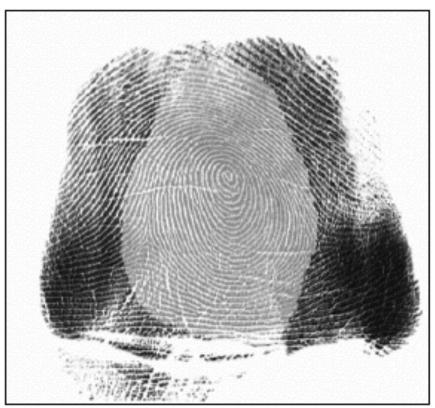

Figure 2.3. The same finger acquired as a plain impression (on the left) and as a rolled impression (on the right): the portion of the rolled fingerprint corresponding to the plain fingerprint is highlighted.

## **Daktylospopie**

### Daktyloskopie (Antropometrie)

- -na světě neexistují dva jedinci, kteří mají absolutně shodné obrazce papilárních linií,
- -obrazce papilárních linií jsou po celý život relativně neměnné,
- -obrazce papilárních linií jsou trvale neodstranitelné, pokud není odstraněna zárodečná vrstva pokožky.

Simon A. Cole, "More Than Zero: Accounting for Error in Latent Fingerprint Identification," Journal of Criminal Law & Criminology, Volume 95, Number 3 (Spring 2005), pp. 985-1078.

Shoda otisků musí být potvrzena dalším hodnotitelem. Hodnotitel musí být spolehlivý a prověřený expert. Pro určení shody je potřeba velký počet identifikačních rysů. Obhájce obžalovaného si může vyžádat dodatečné posouzení shody otisků nezávislým expertem.

http://socialecology.uci.edu/faculty/scole

#### **Rolled fingerprint Impressions**

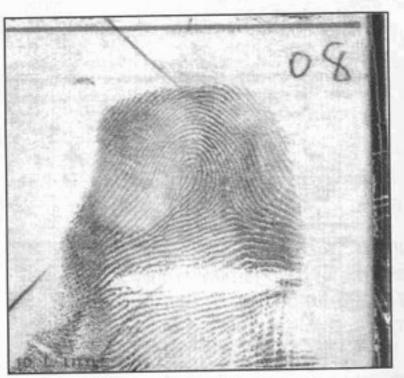

Figure 2.4. Rolled fingerprint images acquired off-line with the ink technique.

#### **Latent fingerprint images**

#### 10 % visible

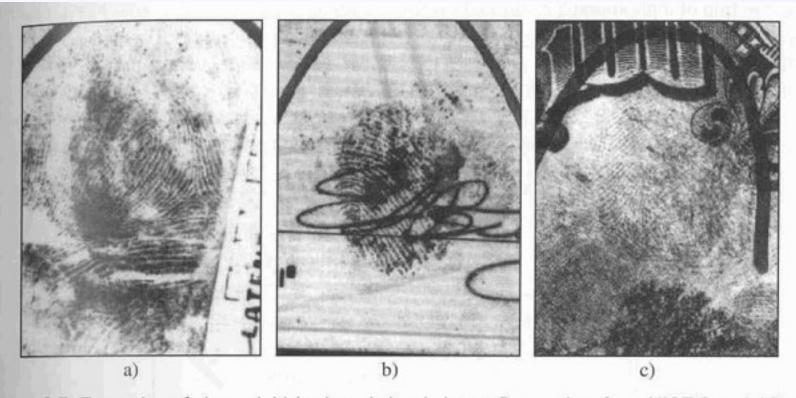

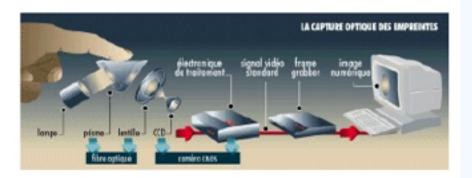

Figure 2.5. Examples of a) good, b) bad, and c) ugly latent fingerprints from NIST Special Database 27 (Garris and McCabe, 2000).

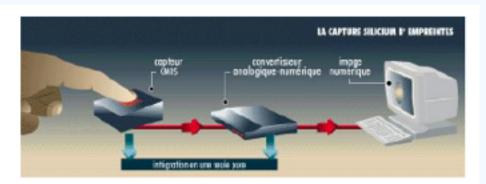

#### Live scan fingerprint sensing

- The most important part of a fingerprint scanner is the sensor.
- All the existing scanners belong to one of the 3 families
   Optical sensors
   Solid state sensors
   Ultrasound sensors

#### Optical scanner

#### CMOS scanner

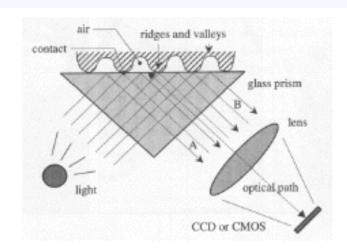

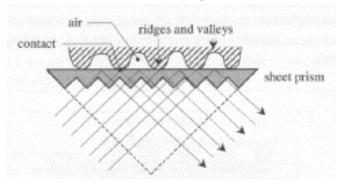

# **Optical sensors**

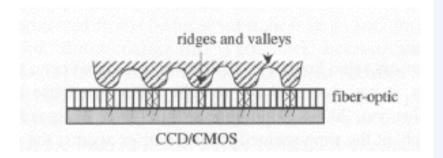

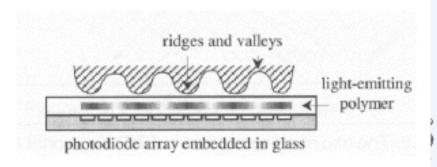

#### Internal reflection optical sensor

Sheet prism optical sensor

Sensor based on optical fibers

Electro-optical fingerprint sensor

# **Optical scanner**

Good quality fingerprint

Dry finger

Wet finger

Intrinsically bad fingerprint

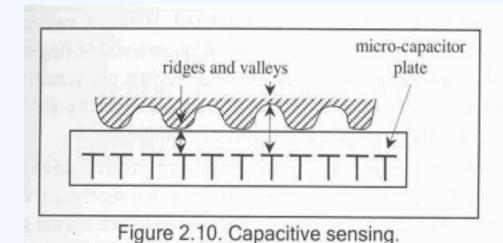

#### **Solid state sensors**

- These are designed to overcome the size and cost problems
- Silicon based sensors are used in this
- Neither optical components nor external CCD/CMOS image sensors are needed
- Four main effects have been produced to convert the physical information into electrical signals
  - Capacitive
  - Thermal
  - Electric field
  - Piezo Electric

### **Capacitive & Piezo- Electric**

Pressure sensitive sensors

Produce an electrical signal when mechanical stress is applied to them

Sensor surface is made up of a non-conducting dielectric material

Ridges and valleys are present at different distances from the surface, they result in different amounts of current

#### **Thermal sensors & Electric field**

- Works based on temperature differentials
- Sensors are made of pyro electric material
- Temperature differential produces an image, but this image soon disappears
  - because the thermal equilibrium is quickly reached and pixel temperature is stabilized
- Solution is sweeping method
- Advantages
  - Not sensitive to ESD
  - Can accept thick protective coating
- Electric field
- Sensor consists of drive ring
- This generates a sinusoidal signal and a matrix of active antennas
- To image a fingerprint, the analogue response of each element in the sensor matrix is amplified, integrated and digitized

#### **Ultrasound sensors**

# -Principle is Echography

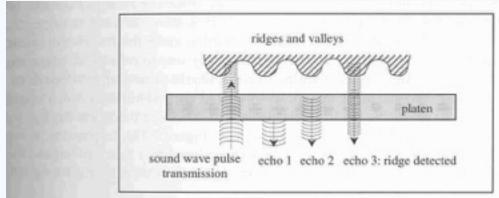

Figure 2.11. The basic principle of the ultrasound technique. Characteristic of sound waves is the ability to penetrate materials, giving a partial echo at each impedance change.

Advantages of Ultrasound sensors
Good Quality images

Disadvantages

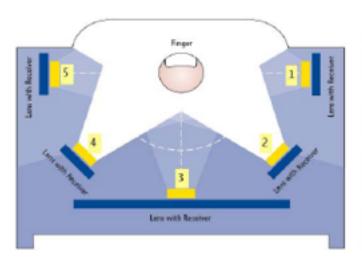

Scanner is large

Mechanical parts are quite expensive

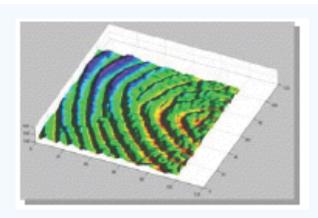

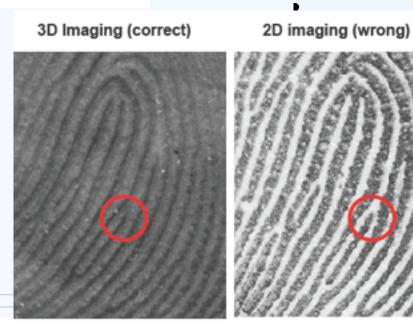

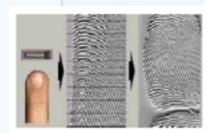

#### **Touch Vs Sweep**

- Drawbacks of Touch method
  - Sensor can become dirty
  - Visible latent fingerprints remains on the sensor
  - Rotation of the fingerprint may be a problem
  - Strict trade-off between the cost and the size of the sensing area

#### **Advantages and drawbacks of Sweeping Method**

Equilibrium is continuously broken when sweeping, as ridges and valleys touch the pixels alternately, introducing a continuous temperature change

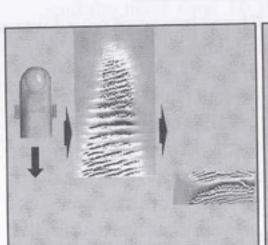

Sensors always look clean No latent fingerprints remain No rotation Novice user may encounter difficulties

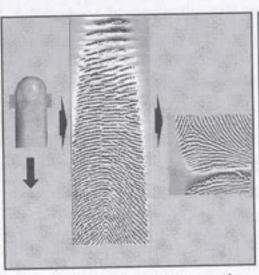

Interface must be able to capture a sufficient number of fingerprint slices

Reconstruction of the image from the slices is time consuming

### **Sweeping Method**

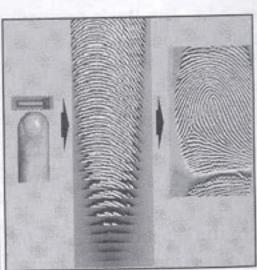

Figure 2.12. As the user sweeps her finger on the sensor, the sensor delivers new image slices, which are combined into a two-dimensional image.

#### Algorithm for fingerprint recognition from the slices

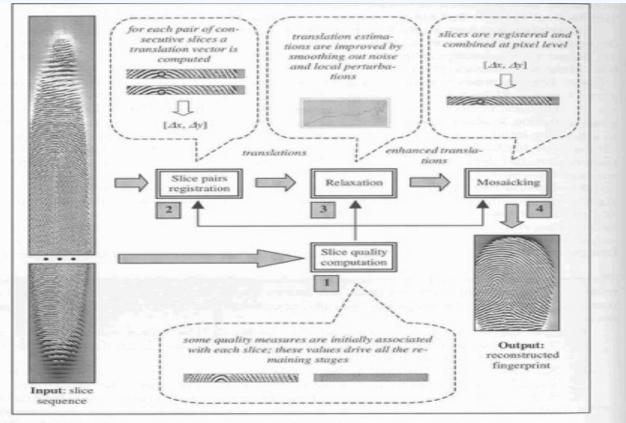

Figure 2.13. An algorithm for fingerprint reconstruction from slices. All the steps are performed sequentially on the whole set of slices. The output of the slice pair registration is a set of translation estimates that are globally enhanced by the relaxation step. These improved estimates drive the mosaicking phase in order to reconstruct the whole fingerprint image.

Main stages are

Slice quality computation Slice pair registration Relaxation Mosaicking

Figure 2.14. Fingerprint images of the same finger with ideal skin condition as acquired by difarent commercial scanners. Images are reported with right proportions: a) Biometrika FX2000, b) Digital Persona UareU2000, c) Identix DFR200, d) Ethentica TactilSense T-FPM, e) STdicroelectronics TouchChip TCS1AD, f) Veridicom FPS110, g) Atmel FingerChip AT77C101B, b) Authentec AES4000.

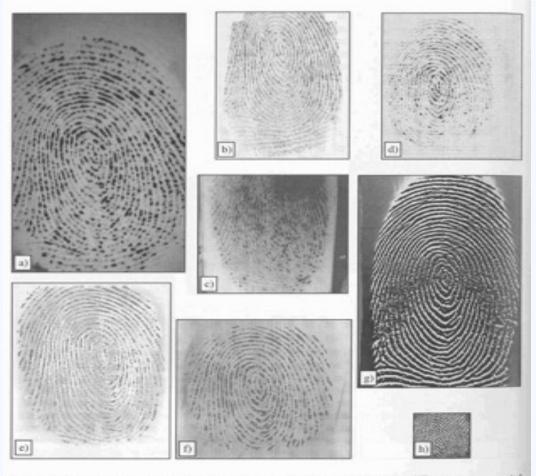

Figure 2.15. Fingerprint images of the same dry finger as acquired by different commercial scanners. Images are reported with right proportions: a) Biometrika FX2000, b) Digital Persona UareU2000, c) Identix DFR200, d) Ethentica TactilSense T-FPM, e) ST-Microelectronics TouchChip TCS1AD, f) Veridicom FPS110, g) Atmel FingerChip AT77C101B, h) Authented AES4000.

Figure 2.16. Fingerprint images of the same wet finger as acquired by different commercial scanners. Images are reported with right proportions: a) Biometrika FX2000, b) Digital Persona UareU2000, c) Identix DFR200, d) Ethentica TactilSense T-FPM, e) ST-Microelectronics TouchChip TCS1AD, f) Veridicom FPS110, g) Atmel FingerChip AT77C101B, h) Authentec AES4000.

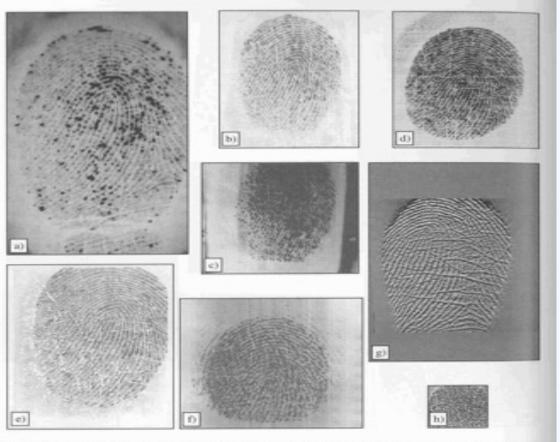

Figure 2.17. Fingerprint images of the same poor quality finger as acquired by different commercial scanners. Images are reported with right proportions: a) Biometrika FX2000, b) Digital Persona UareU2000, c) Identix DFR200, d) Ethentica TactiSense T-FPM, e) ST-Microelectronics TouchChip TCS1AD, f) Veridicom FPS110, g) Atmel FingerChip AT77C1018, h) Authentec AES4000.

### **Storing and Compressing fingerprint images**

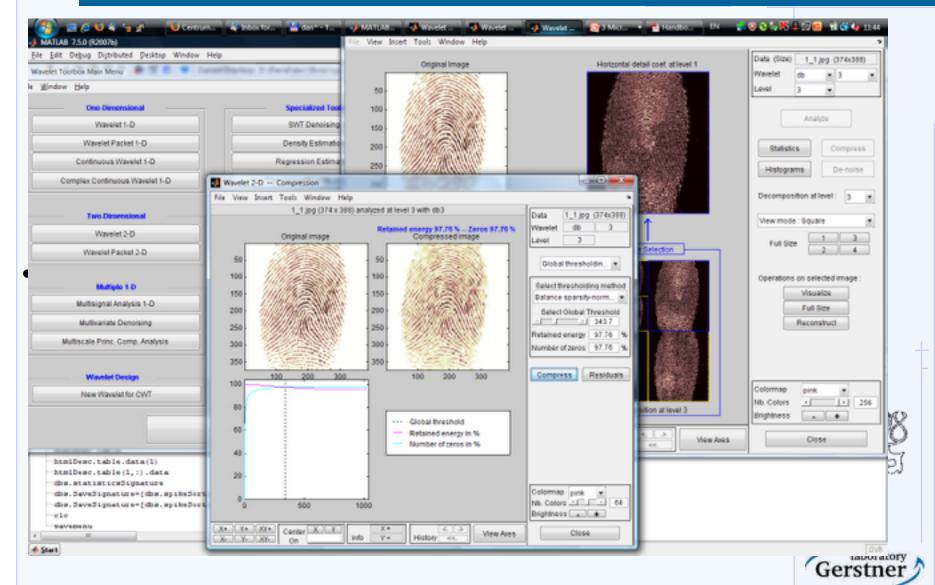

- -Each fingerprint impression produces an image of 768 x 768 ( when digitized at 500 dpi)
- In AFIS applications, this needs more amount of memory space to store these images
- Neither lossless methods or JPEG compression techniques are satisfactory
- A new compression technique called
   Wavelet Scalar Quantization (WSQ) is introduced to compress the images

## DEMO, wavemenu

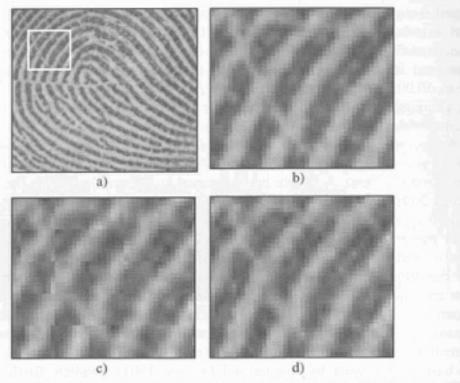

Figure 2.21. Fingerprint compression: a) the central section of a fingerprint image scanned at 500 dpi resolution; b) the marked portion of the image in a); c) the marked portion of the image in a) after the image was compressed using a generic JPEG (www.jpeg.org) image compression algorithm; and d) the marked portion of the image in a) is shown after the image was compressed using the WSQ compression algorithm. Both JPEG and WSQ examples used a compression ratio of 1:12.9; JPEG typically introduces blocky artifacts and obliterates detailed information. Images courtesy of Chris Brislawn, Los Alamos National Laboratory.

### **Enhancement, and Minutias Detection I**

**Daniel Novák**

## **Fingerprint**

Interleaved ridges and valleys

Ridge width:

100µm-300 µm Ridge-valley cycle:

500 µm

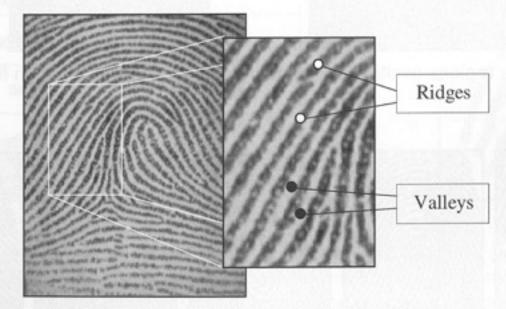

Figure 3.1. Ridges and valleys on a fingerprint image.

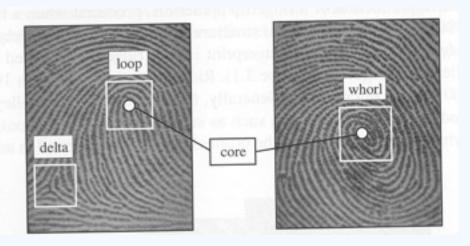

### **A Global Look**

**Singularities:** In the global level the fingerprint pattern shows some distinct shapes

- Loop ( )
- Delta (Δ)
- Whorl (O)...Two facing loop

#### Core:

A reference point for the alignment. The northmost loop type singularity. According to Henry(1900), it is the northmost point of the innermost ridgeline.

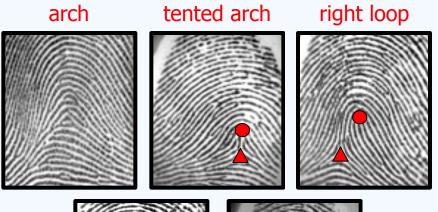

Not all fingerprints have a core (Arch type fingerprints)

### **A Global Look**

Singular regions are commonly used for fingerprint classification:

left loop

whorl

Tzv Henryho systém, rozděluje otisky do pěti tříd Závit (whorl) Levá a pravá smyčka (loop) Oblouk (arch)

Špičatý oblouk (tented arch)

### **Local Look**

Minutia: Small details. Discontinuties in the ridges. (Sir Francis Galton)

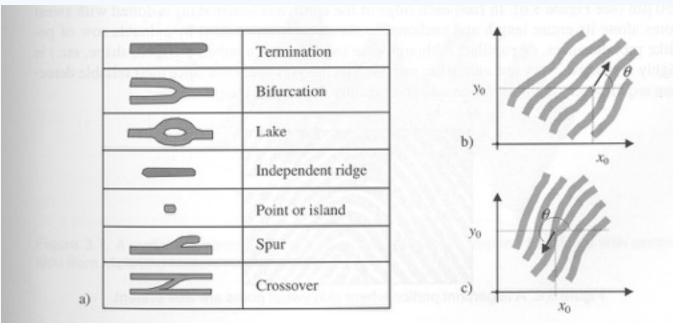

Figure 3.4. a) The most common minutiae types; b) a termination minutia:  $[x_0,y_0]$  are the minutia coordinates;  $\theta$  is the angle that the minutia tangent forms with the horizontal axis; c) a bifurcation minutia:  $\theta$  is now defined by means of the termination minutia corresponding to the original bifurcation that exists in the negative image.

### **Terminologie**

- Papilarni linie
- Vyvýšeniny (ridge)+ prohlubeniny (furrow)
- Charakteristické body
  - Kritické (singulární) body globálně význačné body
    - Jádro
    - Delty
  - Markanty (Minutiaes) lokálně význačné body
    - Rozvětvení (bifurcation)
    - Zakončení (ridge ending)
    - Krátké hrany (short ridge)
    - Překřížení (crossover, bridge)
    - Krátké rozvětvení (spur)
    - Očka (ridge enclosures)

### **Local Look**

Ridge ending / ridge bifurcation duality

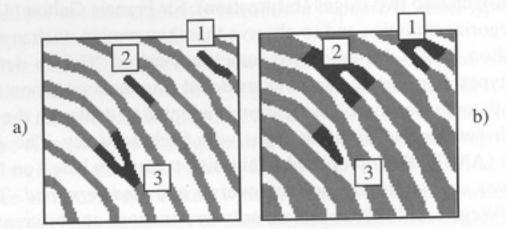

Figure 3.5. The termination/bifurcation duality on a) a binary image and b) its negative image.

### **Sweat Pores**

- High resolution images (1000 dpi)
  Size 60-250 µm
  Highly distinctive

- Not practical (High resolution, good quality images)

Figure 3.6. A fingerprint portion where skin sweat pores are well evident.

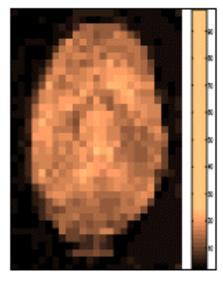

## **Segmentation**

Original

Variance image

Segmented image

Segmentation is the process of isolating foreground from background:

- Image block (16x16 pixels) decomposition
- Thresholding using variance of gradient for each block

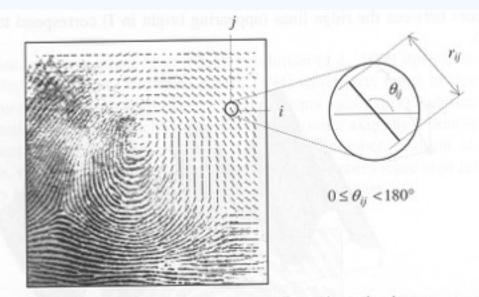

## Segmentation

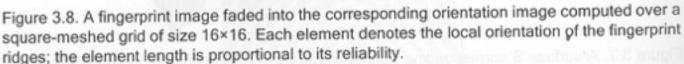

- Separating FP from background
- Straited patterns: no thresholding, striped and oriented pattern & isotropic pattern without orientation
- Segmentation Methods (16x16 block)
  - Variance orthogonal to the ridge direction [Ratha95]
    - Assumption: fingerprint area will exhibit high variance, where as the background and noisy regions will exhibit low variance.
    - Variance can also be used as the quality parameter of the regions.
      - High variance (high contrast): good quality
      - Low variance (low contrast): poor quality
    - Average magnitude of gradient in blocks
      - Fp1 = segmentimage(Fp1);

- Average orientation around indices i,j
- Unoriented directions
- $\nabla f = \left(\frac{\partial f}{\partial x_1}, \dots, \frac{\partial f}{\partial x_n}\right).$ Weighted (r<sub>ii</sub>)
- Gradient, maximum pixel-intensity change, arctan gy/gx

## -Simple Approach

- Gradient with Sobel or Prewitt operators
- $-\Theta_{ij}$  is orthogonal to the direction of the gradient

$$M_x = \begin{bmatrix} -1 & 0 & 1 \\ -1 & 0 & 1 \\ -1 & 0 & 1 \end{bmatrix} \qquad M_y = \begin{bmatrix} -1 & -1 & -1 \\ 0 & 0 & 0 \\ 1 & 1 & 1 \end{bmatrix}$$

$$M_{x} = \begin{bmatrix} -1 & 0 & 1 \\ -2 & 0 & 2 \\ -1 & 0 & 1 \end{bmatrix} \qquad M_{y} = \begin{bmatrix} -1 & -2 & -1 \\ 0 & 0 & 0 \\ 1 & 2 & 1 \end{bmatrix}$$

### Drawbacks:

Non-linear and discontinuous around 90 A single estimate is sensitive to noise Circularity of angles: Averaging is not possible Averaging is not well defined.

-Averaging Gradient Estimates (Kass, Witkin 1987)

$$d_{ij} = [r_{ij}.cos2\theta_{ij}, r_{ij}sin2 \theta_{ij}]$$

$$\overline{\mathbf{d}} = \left[ \frac{1}{n^2} \sum_{i,j} r_{ij} \cdot \cos 2\theta_{ij}, \frac{1}{n^2} \sum_{i,j} r_{ij} \cdot \sin 2\theta_{ij} \right]. \tag{2}$$

$$\nabla_x^2 + \nabla_y^2$$

### Effect of averaging

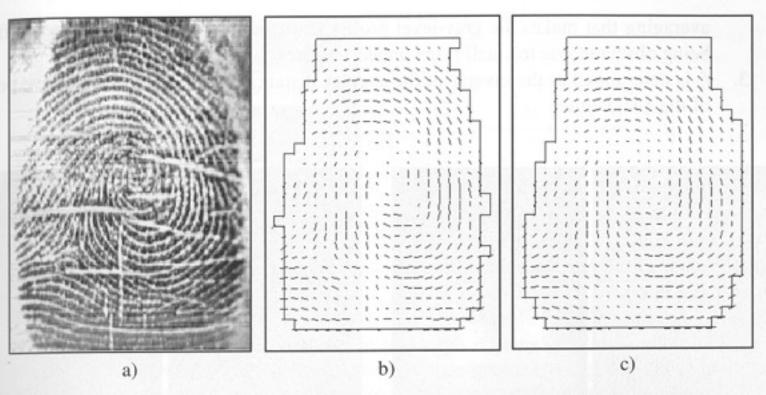

Figure 3.9. a) A poor quality fingerprint image; b) the orientation image of the fingerprint in a) is computed through the Donahue and Rokhlin (1993) method; the orientation of several elements is clearly inconsistent and a regularization step appears necessary; c) the orientation image is the result of the local averaging of each element in b) in its 3 × 3 window according to Equation (2).

## **Orientation field**

An orientation is calculated for each 16x16 block

- Compute the gradient of the smoothed block.  $G_x(i,j)$  and  $G_y(i,j)$  using 3x3 Sobel Masks
- Obtain the dominant direction in the block using the following equation:

$$\theta_{d} = \frac{1}{2} tan^{-1} \begin{pmatrix} \sum_{i=1}^{16} \sum_{j=1}^{16} 2G_{x}(i,j)G_{y}(i,j) \\ \sum_{i=1}^{16} \sum_{j=1}^{16} (G_{x}(i,j)^{2} - G_{y}(i,j)^{2}) \end{pmatrix}, G_{x} \neq 0 \text{ and } G_{y} \neq 0 \\ G_{xy} = \sum_{h=-8}^{8} \sum_{k=-8}^{8} \nabla_{x} (x_{i} + h, y_{j} + k) \cdot \nabla_{y} (x_{i} + h, y_{j} + k), \\ G_{xx} = \sum_{h=-8}^{8} \sum_{k=-8}^{8} \nabla_{x} (x_{i} + h, y_{j} + k)^{2}, \\ G_{yy} = \sum_{h=-8}^{8} \sum_{k=-8}^{8} \nabla_{y} (x_{i} + h, y_{j} + k)^{2}, \\ \theta_{ij} = 90^{\circ} + \frac{1}{2} atan 2 (2G_{xy}, G_{xx} - G_{yy}). \end{pmatrix}$$

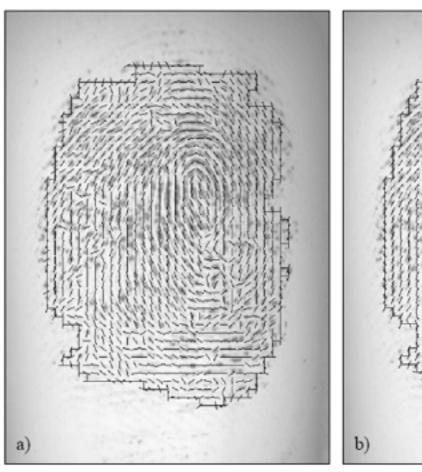

- **DEMO:** Fp1 = computeorientation
- Array(Fp1);
- Gradient is computed by (standard): [fx, fy] = gradient(double(im));
- Block 10x10

## **Example: Orientation field**

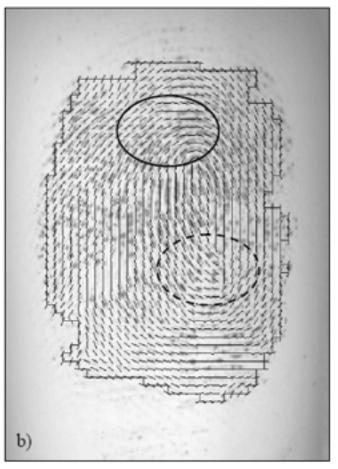

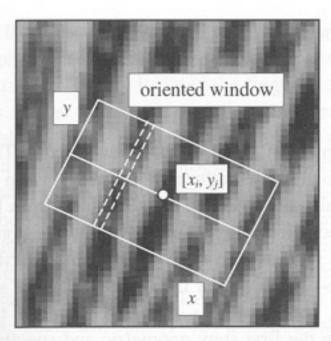

Figure 3.12. a) Estimation of local ridge orientation in a fingerprint through the gradient-based approach corresponding to Equation (3): in the noisy regions the estimation is unreliable; b) two iterations of local (3x3) smoothing are applied, resulting in a more consistent representation; it is worth noting that while the smoothing recovered the correct orientation at several places (e.g., inside the solid circle), it altered the average orientation inside the region denoted by the dashed circle where incorrect orientations were dominating the correct one.

### **Estimation of Local Ridge Frequency**

$$f_{ij} = \frac{4}{s_1 + s_2 + s_3 + s_4}$$

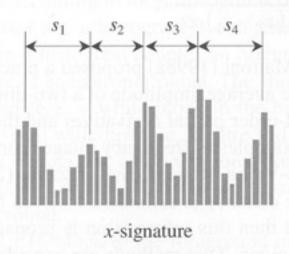

Figure 3.11. An oriented window centered at  $[x_i, y_j]$ ; the dashed lines show the pixels whose gray-levels are accumulated for a given column of the x-signature (Hong, Wan, and Jain, 1998). The x-signature on the right clearly exhibits five peaks; the four distances between consecutive peaks are averaged to determine the local ridge frequency.

### **Estimation of Local Ridge Frequency**

## Simple Algorithm

- 1) 32x16 oriented window centered at  $[x_i, y_i]$
- 2) The x-signature of the grey levels is obtained
- 3) f<sub>ii</sub> is the inverse of the average distance

To handle noise interpolation and/or low pass filtering is applied.

**DEMO:** Fp1 = computelocalfrequency(Fp1, Fp1.imOriginal);

# 用用

### -Examples of frequency maps

Figure 3.10. Two fingerprint images and the corresponding frequency image computed with the method proposed by Maio and Maltoni (1998a). A local  $3 \times 3$  averaging is performed after frequency estimation to reduce noise. Light blocks denote higher frequencies. It is quite evident that significant changes may characterize different fingerprint regions and different average frequencies may result from different fingers.
