Problem Set 2

October 21, 2019

1 Assignment

Problem 2-A Implement a function called `problem2A`, which evaluates Euclidean distances between two sets of points, finds a sphere with centre at the middle-point between two most distant points and calculate its radius. Finally, verify if all points are inside this sphere.

Imagine two sets of points, $\mathbf{p}_m \in \mathcal{P}$, $m \in \{1, \dots, M\}$ and $\mathbf{r}_n \in \mathcal{R}$, $n \in \{1, \dots, N\}$. They are represented by two matrices, $\mathbf{P} \in \mathbb{R}^{M \times 3}$ and $\mathbf{R} \in \mathbb{R}^{N \times 3}$, serving as the sole inputs into the function. The function calculates Euclidean distance between each pair of points, taken one by one from the sets \mathcal{P} and \mathcal{R} , as

$$d_{mn} = |\mathbf{p}_m - \mathbf{r}_n|, \quad \mathbf{D} = [d_{mn}] \in \mathbb{R}^{M \times N}. \quad (1)$$

The distance matrix \mathbf{D} is returned as the first output variable. Finally, the function evaluates the center \mathbf{c} of the sphere given as

$$\mathbf{c} = \frac{1}{2} (\mathbf{p}_{m_c} + \mathbf{r}_{n_c}) \quad (2)$$

with boundary points \mathbf{p}_{m_c} and \mathbf{r}_{n_c} found such that

$$m_c, n_c : \quad a = \frac{1}{2} \max_{m,n} \{\mathbf{D}\}, \quad (3)$$

i.e., two points with the largest distance between them. Check at the end if all points from both sets are within this sphere and return `allPtsIn = true` if the answer is yes and `allPtsIn = false` if contrary is the case. To recap, the header of the function `Problem2A` reads

```
function [D, a, c, allPtsIn] = problem2A(P, R)
```

For the testing purposes, you may use equilateral tetrahedron with unitary sides

$$\mathbf{P} = \mathbf{R} = \begin{bmatrix} -1/2 & 0 & 0 \\ 1/2 & 0 & 0 \\ 0 & \sqrt{3}/2 & 0 \\ 0 & \sqrt{3}/6 & \sqrt{2}/3 \end{bmatrix} \quad (4)$$

with the results

$$\mathbf{D} = \begin{bmatrix} 0 & 1 & 1 & 1 \\ 1 & 0 & 1 & 1 \\ 1 & 1 & 0 & 1 \\ 1 & 1 & 1 & 0 \end{bmatrix}, \quad (5)$$

$a = 1/2$, and $\mathbf{c} = [0 \ 0 \ 0]$. Notice that the center point \mathbf{c} is, in general, not uniquely defined here, see Figure A. Any valid solution is therefore accepted.

A hint: Check out the function `find()`. You may use it with a syntax like

```
[iRow, iCol] = find(A, 1, 'first'); % the first non-zero entry of A is found
```

(2 points)

Figure A: An example of point set $\mathbf{P} = \mathbf{R}$ forming a unitary tetrahedron. The distances between all $m \neq n$ points is $d_{mn} = 1$. The radius of a sphere touching the most distant points is $a = 1/2$ and its center non-unique, position $\mathbf{c} = [0 \ 0 \ 0]$ shown here as red circle.

Problem 2-B Create a function called `problem2B` which can find all Pythagorean triplets up to the number N and calculates how many these triplets are. The header of the function reads

```
function [R, I] = problem2B(N)
```

where \mathbf{R} is the matrix of [Pythagorean triplets](#), described in details below, \mathbf{I} is the number of triplets found, and N is the input variable described below. The output variable \mathbf{R} is a matrix $\mathbf{R} \in \mathbb{Z}^{I \times 4}$ with the following structure

$$\mathbf{R} = \begin{bmatrix} n_1 & a_1 & b_1 & c_1 \\ \vdots & \vdots & \vdots & \vdots \\ n_i & a_i & b_i & c_i \\ \vdots & \vdots & \vdots & \vdots \\ n_I & a_I & b_I & c_I \end{bmatrix}, \quad (6)$$

where

$$n_i = a_i + b_i + c_i. \quad (7)$$

A Pythagorean triplet is a set of three natural numbers, $a_i < b_i < c_i$, for which,

$$c_i^2 = a_i^2 + b_i^2. \quad (8)$$

A well-known example of a Pythagorean triplet is $a_1 = 3$, $b_1 = 4$, and $c_1 = 5$ with $n_1 = 12$. As a sanity check, see the first two correct lines of the output variable \mathbf{R}

$$\mathbf{R} = \begin{bmatrix} 12 & 3 & 4 & 5 \\ 24 & 6 & 8 & 10 \\ \vdots & \vdots & \vdots & \vdots \end{bmatrix}. \quad (9)$$

This problem is freely inspired by the [Project Euler, Problem 9](#).

A hint: Check out the function `find()`. You may use it with a syntax like

```
[iRow, iCol] = find(A, 1, 'first'); % the first non-zero entry of A is found
```

(3 points)

2 Instructions

Complete all the assignments till

- October 27th, 23:59 (Monday's group),
- October 29th, 23:59 (Wednesday's group).

Fill your solutions into m-files called `Problem2_{A-B}` in the Homework checker and start validation via `homework2.p`. You can start the validator as many times as you want. Once all the solutions are valid or you are satisfied with your result, choose option (“0: GENERATE SUBMISSION CODE”), and attach the generated file `HW2token.txt` to the [BRUTE system](#) system. Optionally, you can upload the m-files as well.

All the problems shall be solved by the students individually (notice the BRUTE system has a duplicity checker). Contact matlab@elmag.org with any questions.
