Light & Shading

Jiří Bittner

Outline

- Surface appearance MPG 10
- Radiometry MPG 10.1
- Light sources MPG 10.6
- Surface reflectance models, BRDF MPG 10.2-10.5
- Shading MPG 10.7

Surface Appearance

- Surface geometry
- Light sources
- Surface reflectance

Illumination Enhances Spatial Cues

- Perception of surfaces
 - Surface shape, structure
- Perception of object positions
 - Shadows, indirect illumination

Light Measurements - Radiometry

- Power, Radiant flux (zářivý tok) P , Φ

$$\Phi = \frac{dQ}{dt} [Js^{-1}, W]$$

- How fast photons stream through a given place
- Photon energy (Planck-Einstein relation)

$$E_f = h f [J]$$

$$h = 6.626 \cdot 10^{-34} \text{ Js} \quad \text{Planck constant}$$

- Example

- Radiant flux 1W
- Monochromatic red light 600nm
- Number of photons / s = $1/(h \cdot c / 600 \cdot 10^{-9}) = 3 \cdot 10^{18}$

Radiometry – cont.

- Radiosity (Intenzita vyzařování, Radiozita)

$$B(x) = \frac{d\Phi}{dA} \text{ [W/m}^2\text{]}$$

- How many photons per unit area is emitted from a given place in unit of time (power density)
- Irradiance (Intenzita ozáření) E , [W/m²]
 - How many photons per unit area and unit time reach given place

Radiometry – cont.

- Radiant intensity (Zářivost)

$$I(\mathbf{x}, \omega) = \frac{d\Phi}{d\omega} \text{ [W/sr]}$$

- How many photons per unit angle is emitted in given direction in unit time
- Emission characteristics
 - IES standards

Source: G. Wallner, Geometry of arbitrary light distributions

Radiometry – cont.

- Radiance (Zář)

$$\begin{aligned} L(\mathbf{x}, \omega) &= \frac{dE}{d\omega} \\ &= \frac{d^2\Phi(\mathbf{x})}{\cos \theta \, dA \, d\omega} \quad [\text{Wm}^{-2}\text{sr}^{-1}] \end{aligned}$$

- Camera/eye sensor response is directly **proportional to radiance**
- Other quantities can be obtained by radiance integration

Radiometry vs Photometry

■ Radiometry

- Optical radiation: EM waves $0.01 \mu\text{m}$ - 1mm (ultraviolet to infrared)
- Radiometric quantities functions of wavelength (spectral flux [Wm^{-1}], spectral radiance [$\text{Wm}^{-3}\text{sr}^{-1}$], ...)

■ Photometry

- Describes light – EM waves visible by human eye (380-780nm)
- Radiometric quantities weighted by eye spectral response (CIE luminance function)

$$P = K_m \int_{380\text{nm}}^{770\text{nm}} V(\lambda)R(\lambda)d\lambda \quad K_m = 680\text{lumen/watt}$$

Zdroj: P. Dutre – Global Illumination Compendium

Radiometric & Photometric Quantities

Radiometry			Photometry		
quantity	symbol	unit	quantity	symbol	unit
radiant flux <i>zářivý tok</i>	ϕ	W	luminous flux <i>světelný tok</i>	ϕ_v	lm (Lumen)
irradiance <i>intenzita ozáření</i>	E	W/m ²	illuminance <i>osvětlení</i>	E_v	lx (Lux)
radiant intensity <i>zářivost</i>	I	W/sr	luminous intensity <i>svítivost</i>	I_v	cd (Candela)
radiance <i>zář</i>	L	Wm ⁻² sr ⁻¹	luminance <i>jas</i>	L_v	cd/m ²

Exercise – The Sun

- Radiant flux of the Sun $3.86 \cdot 10^{26} \text{ W}$
- Distance of Earth from Sun $1.5 \cdot 10^{11} \text{ m}$
- Irradiance at upper atmosphere layer?

- **1365 W/m²**
 - Solar constant 1362 W/m^2
- 50% infrared light, 40% visible light, and 10% ultraviolet light
- **546 W/m² visible light**

Exercise – LED Bulb

- Luminous flux of 11W LED light bulb $\Phi_v = 1100lm$
- Distance to a table $d = 1.5m$
- Direct illuminance at table surface $E_v = \frac{1100lm}{4\pi d^2} = 38.9 lx$
- Radiant flux of LED bulb $\Phi = \frac{1100lm}{680lmW^{-1}} = 1.62W$
- Irradiance on the table surface $E = \frac{1.62W}{4\pi d^2} = 0.057Wm^{-2}$

Light Sources

- Directional
 - No origin
 - Constant intensity
- Point
 - Intensity decreases
- Spot lights
- Area
 - Penumbra

Light Sources - examples

A) Omnidirectional point light

B) Spot light

C) Directional light

D) Area light

E) Environment map

Outline

- Surface appearance MPG 10
- Radiometry MPG 10.1
- Light sources MPG 10.6
- Surface reflectance models, BRDF MPG 10.2-10.5
- Shading MPG 10.7

Light Reflection at Surface

ideal diffuse

(surface color dominates)

ideal specular

(light color dominates)

glossy

retro-reflection

real reflection

Light reflection at Surface

- BRDF (bidirectional reflection distribution function)

$$f_r(\omega_i, \omega_r) = \frac{dL_r(\omega_r)}{L_i(\omega_i) \cos \Phi_i d\omega_i}$$

$$dL_r(\omega_r) = f_r(\omega_i, \omega_r) L_i(\omega_i) \cos \Phi_i d\omega_i$$

$$L_r(\omega_r) = \int_{\Omega} f_r(\omega_i, \omega_r) L_i(\omega_i) \cos \Phi_i d\omega_i$$

Reflection equation / Rendering equation

BRDF properties

$$\int_{\Omega} f_r(\omega_i, \omega_r) \cos \Phi_i d\omega_i \leq 1$$

Energy conservation

$$f_r(\omega_i, \omega_r) = f_r(\omega_r, \omega_i)$$

Helmholtz reciprocity

BRDF Visualization

Other Scattering Models

- BTDF - bidirectional transmittance dist. function
- BSDF- bidirectional scattering distribution function
 - BRDF + BTDF
- SVBRDF – spatially varying BRDF
- BSSRDF- bidirectional subsurface scattering reflectance distribution function
- BTF – bidirectional texture function

BSSRDF

- Bidirectional subsurface scattering reflectance distribution function

$$L_r(\omega_r) = \int_A \int_{\Omega} s_r(p_i, \omega_i, p_r, \omega_r) L_i(\omega_i) \cos \Phi_i d\omega_i$$

Scattering Models

- Reflection/Shading/Lighting/Illumination model
 - Modeling BSDF / BRDF
- Scattering model determines surfaces appearance
 - light reflection / refraction
- 1. Empirical
 - Blinn, Phong, Minuart, ...
- 2. Physically based
 - Cook-Torrance, Torrance-Sparrow, ...
- 3. Measured BRDF data

Empirical Scattering Models

- Simple mathematical formula
- Easy and fast to evaluate
- Intuitive control

Phong Illumination Model

- Bui-Tuong Phong, dissertation 1973
- Local illumination model
 - Not a physically plausible BRDF model
- Surface color composed of:
 - Ambient light I_A
 - Diffuse reflection I_D
 - Specular reflection I_S
- $I = I_A + I_D + I_S$
- Color computed by components (r, g, b)

Ambient Component

- Omnidirectional illumination (light noise)
 - Mimics global illumination (much simplified!)
 - Constant for the whole scene

$$I_A = C_A \cdot (C_D \cdot k_A)$$

- C_A – color of ambient light
- C_D – surface color (as for diffuse component)
- $k_A \in \langle 0,1 \rangle$ – ambient reflection coefficient

Diffuse Component

- Ideally matte object
- Depends on angle between L and N

$$I_D = C_L \cdot C_D \cdot k_D \cdot \cos(\alpha)$$

- C_L light color
- C_D surface color
- $k_D \in <0,1>$ Diffuse reflection coef.
- $\cos(\alpha)$ = dot product of L and N

Specular Component

- Ideally specular object
- Depends on angle between E and R

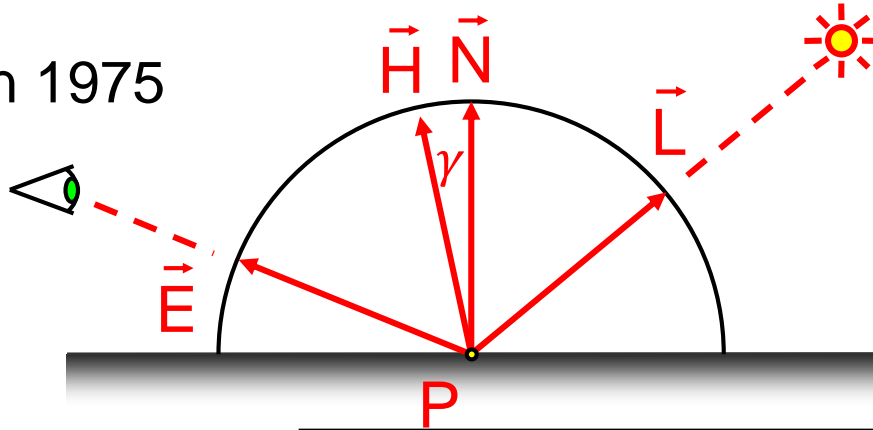

$$I_S = C_L \cdot C_S \cdot k_S \cdot \cos^h(\beta)$$

- specular color C_S
- $k_S \in \langle 0, 1 \rangle$
- $h \in \langle 1, \infty \rangle$, shininess (ostrość odrazu)
- $\cos(\beta) = \text{dot product of E and R}$

Blinn-Phong Illumination Model

- Jim Blinn 1975

$$H = (L+E)/2$$

$$I_s = C_L \cdot C_s \cdot k_s \cdot \cos^h(\gamma)$$

OpenGL / DirectX

Use 4x higher h than Phong!

Blinn-Phong

Phong

Blinn-Phong
(higher exponent)

Examples - Phong

$k_S \backslash k_D$	0.0	0.5	1.0
0.0			
0.5			
1.0			

$k_A = 0.0, h = 50$

Shininess - Phong

$$k_A = 0.0$$

$$k_D = 0.5$$

$$k_S = 1$$

Blinn-Phong Model Summary

- More light sources L_i

$$I = I_A + \sum_i (I_D + I_S)$$

- Practical setting of Phong model

$$k_A + k_D + k_S \leq 1$$

Physically Plausible Phong Model

- [Lafortune & Willems 1994]

$$f_r(\omega_i, \omega_r) = \frac{k_d}{\pi} + \frac{k_s(n+2)}{2\pi} \cos^n \alpha$$

$$k_s + k_d \leq 1$$

- Helmholtz reciprocity & Energy conservation
 - Use in physically correct renderer !

Ward BRDF

- Empirical (as Phong, Blinn)
 - Good to fit measured data
- Anisotropic specular reflection!
 - Gaussians
- Params
 - $k_d, k_s, \alpha_x, \alpha_y$

$$f_r = \frac{k_d}{\pi} + k_s \frac{e^{-\tan^2 \theta_h \left(\frac{\cos^2 \phi_h}{\alpha_x} + \frac{\sin^2 \phi_h}{\alpha_y} \right)}}{4\pi \alpha_x \alpha_y \sqrt{\cos \theta_i \cos \theta_o}}$$

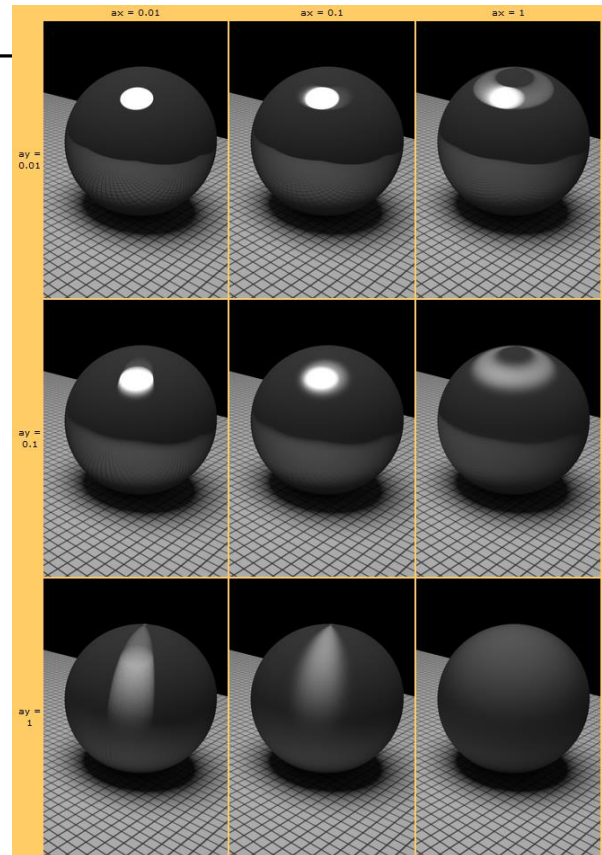

Image: Chia-Kai Liang

Physically Based Models

- Microfacet distribution – “V” grooves
- Normal distribution (D)
- Shadowing-masking (G)
- Fresnel term (F)

Microfacet models

- Normal distribution (D)
- Microfacet distribution – “V” grooves
 - Model surface roughness

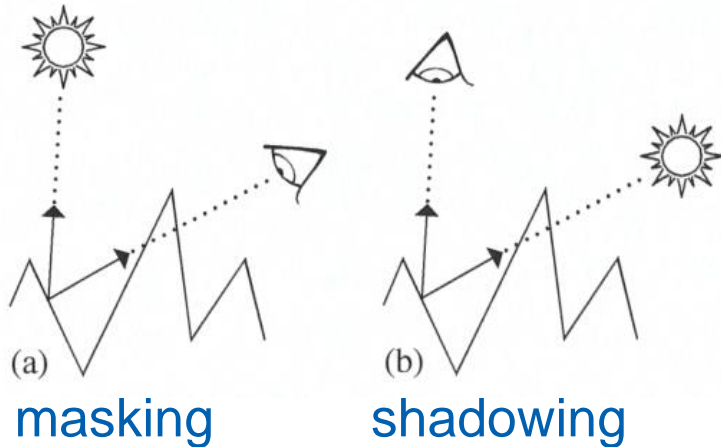

$$D(\omega_h) = \frac{e^{(-\tan^2 \theta_h)/\alpha^2}}{\pi \alpha^2 \cos^4 \theta_h}$$

α roughness

Microfacet models

- Shadowing-masking (G)

$$G(\omega_i, \omega_r) = \min\left(1, \frac{2 \cos \theta_h \cos \theta_r}{\omega_r h}, \frac{2 \cos \theta_h \cos \theta_i}{\omega_r h}\right)$$

Microfacet models

- Fresnel term (F)
 - reflection / transmission on media interface

$$F(\omega_r) = F_0 + (1 - F_0)(1 - \cos(\theta_r))^5, F_0 = \left(\frac{\eta_1 - \eta_2}{\eta_1 + \eta_2} \right)^2$$

Cook-Torrance BRDF for specular surfaces

- Specular microfacets
- Normal distribution (D), shadowing-masking (G), Fresnel term (F) 

$$f_r(\omega_i, \omega_r) = \frac{D(\omega_h) G(\omega_i, \omega_r) F(\omega_r)}{4 \cos \theta_i \cos \theta_r}$$

Cook & Torrance: A reflectance model for computer graphics, TOG 1982.

Oren-Nayar BRDF for diffuse surfaces

- Diffuse microfacets

- Functional approximation to analytic solution for rough surf.

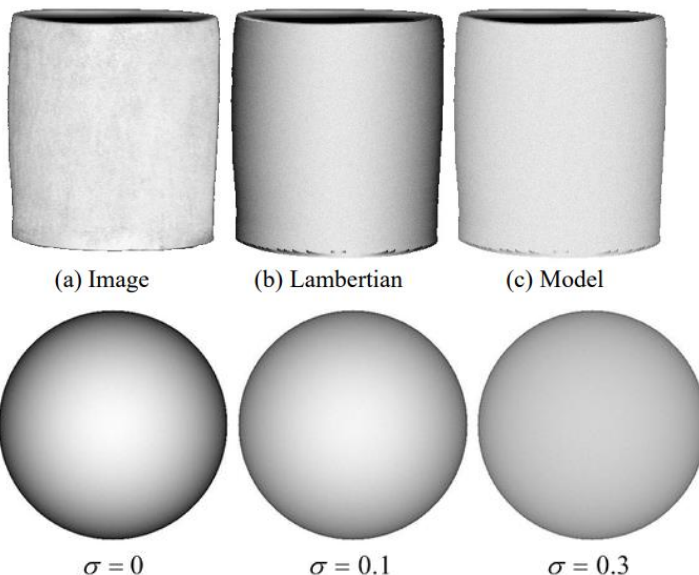

$$f_r(\omega_i, \omega_r) = \frac{\rho}{\pi} (A + (B \max[0, \cos(\phi_i - \phi_r)] \sin \alpha \tan \beta))$$

$$A = 1 - 0.5 \frac{\sigma^2}{\sigma^2 + 0.33}$$

$$B = 0.45 \frac{\sigma^2}{\sigma^2 + 0.09}$$

$$\alpha = \max(\theta_i, \theta_r)$$

$$\beta = \min(\theta_i, \theta_r)$$

Layered models

Illumination Models

- DEMO

Outline

- Surface appearance MPG 10
- Radiometry MPG 10.1
- Light sources MPG 10.6
- Surface reflectance models, BRDF MPG 10.2-10.5
- Shading MPG 10.7

Shading

- Determining colors / shades of all patch points
 - Constant color
 - Interpolation of colors from vertices
 - Interpolation of normals from vertices

Smooth Shading

- Gouraud interpolation of color
 - Good for diffuse surfaces
 - Illumination model computed apriori
 - Simple HW support
- Phong interpolation of normals
 - More realistic for glossy surfaces
 - Illumination model computed for all surface points
 - Slower

Principle of Bilinear Interpolation

$$f_X = (1-\gamma) \cdot [(1-\alpha) \cdot f_A + \alpha \cdot f_C] + \gamma \cdot [(1-\beta) \cdot f_B + \beta \cdot f_D]$$

Computing Vertex Normals

- Analytically (from surface definition)
- From normals of neighboring faces:

$$N = (N_1 + N_2 + N_3 + N_4) / 4$$

Real and Auxiliary Edges

a) Stored in model:

$$N_V = (N_2 + N_3) / 2$$

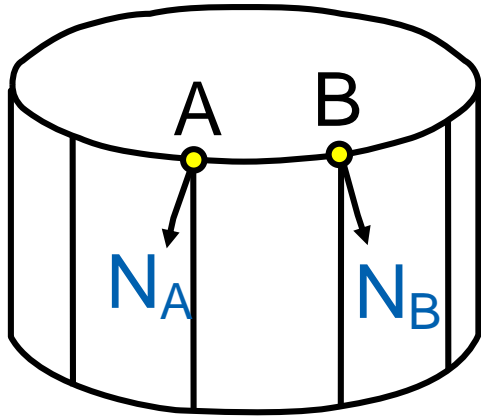

b) *Computed using crease angle*

Gouraud versus Phong Shading

- Gouraud does not capture maximal reflection
- Gouraud not invariant to rotation – temporal artifacts

Gouraud

Phong

Normal Interpolation

- Simplified interpolation
 - Linear interpolation by components
 - With normalization
 - Without normalization: neglecting error

Outline
