Part I Data Types	Numeric TypesCharacter TypeLogical TypeType CastArraysPointersBasic Data TypesBasic (built-in) types are numeric integer and floating types Logical data type has been introduced in C99C data type keywords are• Integer types: int, long, short, and char Range "modifiers": signed, unsigned• Floating types: float, double May also be used as long double• Character type: char• Data type with empty set of possible values: void Logical data type: _Bool• Size of the memory representation depends on the system, compiler, etc. • The actual size of the data type can be determined by the sizeof operator• New data type can be introduced by the typedef keyword
Jan Faigl, 2020 B3B36PRG – Lecture 03: Data types, Memory Storage Classes 3 / 57	Jan Faigl, 2020 B3B36PRG - Lecture 03: Data types, Memory Storage Classes 5 / 57

Numeric Types         Character Type         Logical Type         Type Cast         Arrays         Pointers	Numeric Types         Character Type         Logical Type         Type Cast         Arrays         Pointers
Floating Types	Character – char
C provides three floating types	A single character (letter) is of the char type
float – Single-precision floating-point	<ul> <li>It represents an integer number (byte)</li> </ul>
Suitable for local computations with one decimal point	Character encoding (graphics symbols), e.g., ASCII – American Standard Code for Infor-
<ul> <li>double – Double-precision floating-point</li> <li>Usually fine for most of the programs</li> </ul>	mation Interchange.
long double – Extended-precision floating-point Rarely used	The value of char can be written as constant, e.g., 'a'.
C does not define the precision, but it is mostly IEEE 754 ISO/IEC/IEEE 60559:2011	$_{2}^{1}$ char c = 'a';
double – 64 bits (8 bytes) with sign, exponent, and mantissa	<pre>3 printf("The value is %i or as char '%c'\n", c, c);</pre>
• $s-1$ bit sign (+ or -)	lec03/char.c
Exponent – 11 bits, i.e., 2048 numbers	clang char.c && ./a.out
Mantissa – 52 bits $pprox$ 4.5 quadrillions numbers	The value is 97 or as char 'a'
A rational number x is stored according to	There are defined several control characters for output devices
$x = (-1)^s$ Mantisa · 2 <sup>Exponent-Bias</sup>	The so-called escape sequences
x = (-1) wantisa 2	<ul> <li>\t - tabular, \n - newline,</li> </ul>
Bias allows to store exponent always as positive number	\a – beep, \b – backspace, \r – carriage return,
It can be further tuned, e.g., $Bias = 2^{eb-1}-1$ , where eb is the number bits of the exponent.	<ul> <li>\f – form feed, \v – vertical space</li> </ul>
Jan Faigl, 2020 B3B36PRG – Lecture 03: Data types, Memory Storage Classes 10 / 57	Jan Faigl, 2020 B3B36PRG – Lecture 03: Data types, Memory Storage Classes 12 / 57
Numeric Types         Character Type         Logical Type         Type Cast         Arrays         Pointers	Numeric Types         Character Type         Logical Type         Type Cast         Arrays         Pointers
Boolean type – _Bool	Type Conversions – Cast
In C99, the logical data type _Bool has been introduced	
_Bool logic_variable;	Type conversion transforms value of some type to the value of different type
_bool logic_vallable,	Type conversion can be
The value true is any value of the type int different from 0	Implicit – automatically, e.g., by the compiler for assignment
In the header file stdbool.h, values of true and false are defined together with the	Explicit – must be prescribed using the cast operator
type bool	Type conversion of the int type to the double type is implicit
Using preprocessor	Value of the int type can be used in the expression, where a value of the double type is
#define false 0	expected. The int value is automatically converted to the double value.
#define true 1	Exampl
#define bool _Bool	double x;
	int i = 1;
In the former (ANSI) C, an explicit data type for logical values is not defined	x = i; // the int value 1 is automatically converted
A similar definition as in <stdbool.h> can be used</stdbool.h>	<pre>// to the value 1.0 of the double type</pre>
#define FALSE 0	Implicit type conversion is safe
#define TRUE 1	- Implicit type conversion is sale
Jan Faigl, 2020 B3B36PRG – Lecture 03: Data types, Memory Storage Classes 14 / 57	Jan Faigl, 2020 B3B36PRG – Lecture 03: Data types, Memory Storage Classes 16 / 57
