# Overview

- 1 Area patrol
- 2 Illuminating Orthogonal Polygons
- 3 Clearing polygons
- 4 Double Oracle

# Reducing the size of the patrolling graph

Given following patrolling problem, remove unnecessary nodes and edges from the graph.

Figure: Given patrolling problem.

# Example of reduced graph

# Illuminating Orthogonal Polygons

Prove the following theorem

## Theorem

$\lfloor \frac{n}{4} \rfloor$  stationary guards are always sufficient and occasionally necessary to illuminate a orthogonal polygon with  $n$  vertices.

Figure: Orthogonal polygon with 24 vertices

# First part of the proof

## Theorem

*Any orthogonal polygon is convex quadrilaterizable.*

## Proof.

Showing that every orthogonal polygon can be split to smaller polygons eventually resulting in convex quadrilaterals. Full proof [here](#) on page 56.  $\square$

**Figure:** Quadrilateralization of the polygon (blue lines) and diagonals of resulting quadrilaterals (red)

# End of the proof

## Theorem

*Quadrilateralized polygon with diagonal edges in quadrilaterals forms a 4-colorable graph.*

## Proof.

Dual graph  $Q$  is clearly a tree. When  $Q$  is one quadrilateral it is 4-colorable. By induction show that  $Q$  with added leaf quadrilateral is still 4-colorable.  $\square$

By the construction of the graph each quadrilateral has all four colors. Therefore, placing guards to one color illuminates the polygon. Selecting color with the fewest vertices gives the result.

Figure: 4-colored polygon.

# Necessary

Figure: Class of polygons where  $\lfloor \frac{n}{4} \rfloor$  guards is necessary.

# Gap edges

Figure: Gap edges in the example polygon.

# Gap edges and dual graph

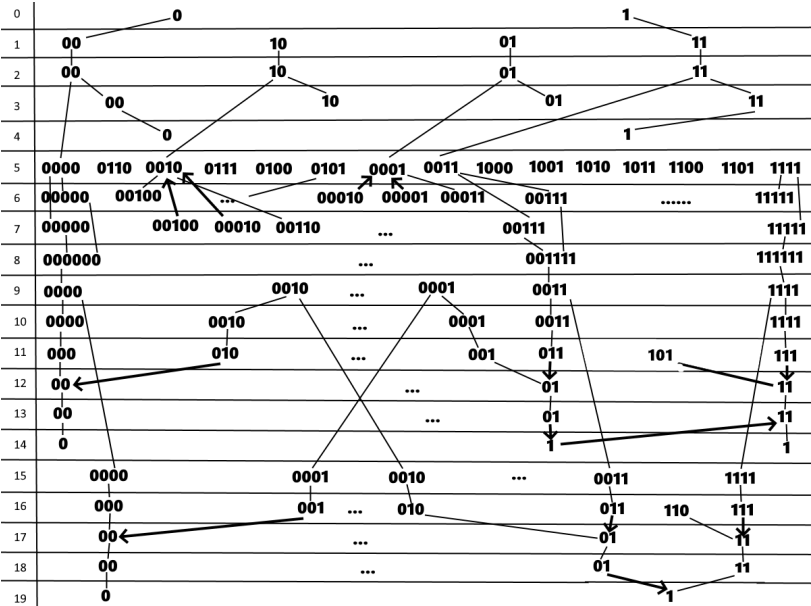

Figure: Gap edges and the dual graph corresponding to them.

## Reminder of transitions in Gap edge algorithm

- When new gap edge appears label it Cleared
- When gap edge splits to two label them according to the original edge label
- When two gap edges join and at least one of them is Contaminated the resulting edge is contaminated, otherwise it is Cleared

# Gap edges final graph

# Gap edges final solution

# Double Oracle reminder

- Used to find Nash Equilibrium of zero-sum two-player game (in our example normal form game)
- Pick randomly one action for each players and form restricted subgame using those actions
- Players are switching during the iterations
- In each iteration find the best response to current strategy for the current player and add it to the restricted subgame, then solve the subgame again
- When in subsequent iterations best responses for both players are already in the restricted subgame, stop

# Double Oracle

Try Double Oracle algorithm on the following matrix game

	A	B	C	D	E
V	-8	9	0	7	-6
W	6	9	6	5	6
X	1	-8	3	8	7
Y	5	2	6	-5	2
Z	4	3	3	0	8

# Double Oracle

Player 1 selects  $W \rightarrow A = 1, V = 0, W = 1$

	A	B	C	D	E
V	-8	9	0	7	-6
W	6	9	6	5	6
X	1	-8	3	8	7
Y	5	2	6	-5	2
Z	4	3	3	0	8

# Double Oracle

Player 2 selects D  $\rightarrow$  solve matrix game

	A	B	C	D	E
V	-8	9	0	7	-6
W	6	9	6	5	6
X	1	-8	3	8	7
Y	5	2	6	-5	2
Z	4	3	3	0	8

# Double Oracle

Strategy for Player 2  $A = \frac{1}{8}, D = \frac{7}{8}$

	A	B	C	D	E	
V	-8	9	0	7	-6	5.125
W	6	9	6	5	6	5.125
X	1	-8	3	8	7	7.125
Y	5	2	6	-5	2	-3.75
Z	4	3	3	0	8	0.5

# Double Oracle

Player 1 selects X  $\rightarrow$  solve matrix game

	A	B	C	D	E
V	-8	9	0	7	-6
W	6	9	6	5	6
X	1	-8	3	8	7
Y	5	2	6	-5	2
Z	4	3	3	0	8

# Double Oracle

Strategy for Player 2  $A = \frac{3}{8}, D = \frac{5}{8}$   
Strategy for Player 1  $V = 0, W = \frac{7}{8}, X = \frac{1}{8}$

	A	B	C	D	E	
V	-8	9	0	7	-6	1.375
W	6	9	6	5	6	5.375
X	1	-8	3	8	7	5.375
Y	5	2	6	-5	2	-1.25
Z	4	3	3	0	8	1.5
	$5\frac{3}{8}$	$6\frac{7}{8}$	$5\frac{5}{8}$	$5\frac{3}{8}$	$6\frac{1}{8}$	

# The End
