## Unreliable actions in observable grid world

States  $s \in \mathcal{S}$ , actions  $a \in \mathcal{A}$

(Transition) Model  $T(s, a, s') \equiv p(s'|s, a)$  = probability that  $a$  in  $s$  leads to  $s'$

## Unreliable actions in observable grid world

States  $s \in \mathcal{S}$ , actions  $a \in \mathcal{A}$

(Transition) Model  $T(s, a, s') \equiv p(s'|s, a) =$  probability that  $a$  in  $s$  leads to  $s'$

## Unreliable (results of) actions

# Plan? Policy

- ▶ In deterministic world: **Plan** – sequence of actions from **Start** to **Goal**.
- ▶ MDPs, we need a **policy**  $\pi : \mathcal{S} \rightarrow \mathcal{A}$ .
- ▶ An action for each possible state. *Why each?*
- ▶ What is the *best* policy?

# Plan? Policy

- ▶ In deterministic world: **Plan** – sequence of actions from **Start** to **Goal**.
- ▶ MDPs, we need a **policy**  $\pi : \mathcal{S} \rightarrow \mathcal{A}$ .
- ▶ An action for each possible state. Why *each*?
- ▶ What is the *best* policy?

# Plan? Policy

## Rewards

-0.04	-0.04	-0.04	1.00
-0.04		-0.04	-1.00
-0.04	-0.04	-0.04	-0.04

**Reward** : Robot/Agent takes an action  $a$  and it is **immediately** rewarded.

**Reward function**  $r(s)$  (or  $r(s, a)$ ,  $r(s, a, s')$ )  
=  $\begin{cases} -0.04 & \text{(small penalty) for nonterminal states} \\ \pm 1 & \text{for terminal states} \end{cases}$

# Markov Decision Processes (MDPs)

(a)

(b)

States  $s \in \mathcal{S}$ , actions  $a \in \mathcal{A}$

Model  $T(s, a, s') \equiv p(s'|s, a) =$  probability that  $a$  in  $s$  leads to  $s'$

Reward function  $r(s)$  (or  $r(s, a)$ ,  $r(s, a, s')$ )

$$= \begin{cases} -0.04 & \text{(small penalty) for nonterminal states} \\ \pm 1 & \text{for terminal states} \end{cases}$$

# Markov Decision Processes (MDPs)

(a)

(b)

States  $s \in \mathcal{S}$ , actions  $a \in \mathcal{A}$

**Model**  $T(s, a, s') \equiv p(s'|s, a) =$  probability that  $a$  in  $s$  leads to  $s'$

**Reward function**  $r(s)$  (or  $r(s, a)$ ,  $r(s, a, s')$ )

$$= \begin{cases} -0.04 & \text{(small penalty) for nonterminal states} \\ \pm 1 & \text{for terminal states} \end{cases}$$

## Markovian property

- ▶ Given the present state, the future and the past are independent.
- ▶ MDP: Markov means action depends only on the current state.
- ▶ In search: successor function (transition model) depends on the current state only.

- A: A-a, B-b, C-c  
 B: A-b, B-a, C-c  
 C: A-b, B-c, C-a  
 D: A-c, B-a, C-b

## Utilities of sequences

- ▶ State reward at time/step  $t$ ,  $R_t$ .
- ▶ State at time  $t$ ,  $S_t$ . State sequence  $[S_0, S_1, S_2, \dots, ]$

Typically, consider **stationary preferences** on reward sequences:

$$[R, R_1, R_2, R_3, \dots] \succ [R, R'_1, R'_2, R'_3, \dots] \Leftrightarrow [R_1, R_2, R_3, \dots] \succ [R'_1, R'_2, R'_3, \dots]$$

If **stationary preferences** :

Utility ( $h$ -history)

$$U_h([S_0, S_1, S_2, \dots, ]) = R_1 + R_2 + R_3 + \dots$$

If the horizon is finite - limited number of steps - preferences are **nonstationary** (depends on how many steps left).

## Returns and Episodes

- ▶ Executing policy - sequence of states and **rewards**.
- ▶ **Episode** starts at  $t$ , ends at  $T$  (ending in a terminal state).
- ▶ **Return** (Utility) of the episode (policy execution)

$$G_t = R_{t+1} + R_{t+2} + R_{t+3} + \cdots + R_T$$

## Comparing policies: Finite vs. infinite horizon

Problem: Infinite lifetime  $\Rightarrow$  additive utilities are infinite.

- ▶ Finite horizon: termination at a fixed time  $\Rightarrow$  nonstationary policy,  $\pi(s)$  depends on the time left.
- ▶ Absorbing (terminal) state.
- ▶ Discounted return ,  $\gamma < 1, R_t \leq R_{\max}$

$$G_t = R_{t+1} + \gamma R_{t+2} + \gamma^2 R_{t+3} + \dots = \sum_{k=0}^{\infty} \gamma^k R_{t+k+1} \leq \frac{R_{\max}}{1-\gamma}$$

Returns are successive steps related to each other

$$\begin{aligned} G_t &= R_{t+1} + \gamma R_{t+2} + \gamma^2 R_{t+3} + \gamma^3 R_{t+4} + \dots \\ &= R_{t+1} + \gamma (R_{t+2} + \gamma R_{t+3} + \gamma^2 R_{t+4} + \dots) \\ &= R_{t+1} + \gamma G_{t+1} \end{aligned}$$

## Comparing policies: Finite vs. infinite horizon

Problem: Infinite lifetime  $\Rightarrow$  additive utilities are infinite.

- ▶ Finite horizon: termination at a fixed time  $\Rightarrow$  nonstationary policy,  $\pi(s)$  depends on the time left.
- ▶ Absorbing (terminal) state.
- ▶ Discounted return ,  $\gamma < 1, R_t \leq R_{\max}$

$$G_t = R_{t+1} + \gamma R_{t+2} + \gamma^2 R_{t+3} + \dots = \sum_{k=0}^{\infty} \gamma^k R_{t+k+1} \leq \frac{R_{\max}}{1-\gamma}$$

Returns are successive steps related to each other

$$\begin{aligned} G_t &= R_{t+1} + \gamma R_{t+2} + \gamma^2 R_{t+3} + \gamma^3 R_{t+4} + \dots \\ &= R_{t+1} + \gamma (R_{t+2} + \gamma R_{t+3} + \gamma^2 R_{t+4} + \dots) \\ &= R_{t+1} + \gamma G_{t+1} \end{aligned}$$

## Comparing policies: Finite vs. infinite horizon

Problem: Infinite lifetime  $\Rightarrow$  additive utilities are infinite.

- ▶ Finite horizon: termination at a fixed time  $\Rightarrow$  nonstationary policy,  $\pi(s)$  depends on the time left.
- ▶ Absorbing (terminal) state.
- ▶ Discounted return ,  $\gamma < 1, R_t \leq R_{\max}$

$$G_t = R_{t+1} + \gamma R_{t+2} + \gamma^2 R_{t+3} + \dots = \sum_{k=0}^{\infty} \gamma^k R_{t+k+1} \leq \frac{R_{\max}}{1-\gamma}$$

Returns are successive steps related to each other

$$\begin{aligned} G_t &= R_{t+1} + \gamma R_{t+2} + \gamma^2 R_{t+3} + \gamma^3 R_{t+4} + \dots \\ &= R_{t+1} + \gamma (R_{t+2} + \gamma R_{t+3} + \gamma^2 R_{t+4} + \dots) \\ &= R_{t+1} + \gamma G_{t+1} \end{aligned}$$

## Comparing policies: Finite vs. infinite horizon

Problem: Infinite lifetime  $\Rightarrow$  additive utilities are infinite.

- ▶ Finite horizon: termination at a fixed time  $\Rightarrow$  nonstationary policy,  $\pi(s)$  depends on the time left.
- ▶ Absorbing (terminal) state.
- ▶ Discounted return ,  $\gamma < 1, R_t \leq R_{\max}$

$$G_t = R_{t+1} + \gamma R_{t+2} + \gamma^2 R_{t+3} + \dots = \sum_{k=0}^{\infty} \gamma^k R_{t+k+1} \leq \frac{R_{\max}}{1-\gamma}$$

Returns are successive steps related to each other

$$\begin{aligned} G_t &= R_{t+1} + \gamma R_{t+2} + \gamma^2 R_{t+3} + \gamma^3 R_{t+4} + \dots \\ &= R_{t+1} + \gamma (R_{t+2} + \gamma R_{t+3} + \gamma^2 R_{t+4} + \dots) \\ &= R_{t+1} + \gamma G_{t+1} \end{aligned}$$

## Comparing policies: Finite vs. infinite horizon

Problem: Infinite lifetime  $\Rightarrow$  additive utilities are infinite.

- ▶ Finite horizon: termination at a fixed time  $\Rightarrow$  nonstationary policy,  $\pi(s)$  depends on the time left.
- ▶ Absorbing (terminal) state.
- ▶ Discounted return ,  $\gamma < 1, R_t \leq R_{\max}$

$$G_t = R_{t+1} + \gamma R_{t+2} + \gamma^2 R_{t+3} + \dots = \sum_{k=0}^{\infty} \gamma^k R_{t+k+1} \leq \frac{R_{\max}}{1-\gamma}$$

Returns are successive steps related to each other

$$\begin{aligned} G_t &= R_{t+1} + \gamma R_{t+2} + \gamma^2 R_{t+3} + \gamma^3 R_{t+4} + \dots \\ &= R_{t+1} + \gamma (R_{t+2} + \gamma R_{t+3} + \gamma^2 R_{t+4} + \dots) \\ &= R_{t+1} + \gamma G_{t+1} \end{aligned}$$

## Comparing policies: Finite vs. infinite horizon

Problem: Infinite lifetime  $\Rightarrow$  additive utilities are infinite.

# MDPs recap

## Markov decision processes (MDPs):

- ▶ Set of states  $\mathcal{S}$
- ▶ Set of actions  $\mathcal{A}$
- ▶ Transitions  $p(s'|s, a)$  or  $T(s, a, s')$
- ▶ Reward function  $r(s, a, s')$ ; and discount  $\gamma$

## MDP quantities:

- ▶ (deterministic) Policy  $\pi(s)$  – choice of action for each state
- ▶ Return (Utility) of an episode (sequence) – sum of (discounted) rewards.

# MDPs recap

## Markov decision processes (MDPs):

- ▶ Set of states  $\mathcal{S}$
- ▶ Set of actions  $\mathcal{A}$
- ▶ Transitions  $p(s'|s, a)$  or  $T(s, a, s')$
- ▶ Reward function  $r(s, a, s')$ ; and discount  $\gamma$

## MDP quantities:

- ▶ (deterministic) Policy  $\pi(s)$  – choice of action for each state
- ▶ Return (Utility) of an episode (sequence) – sum of (discounted) rewards.

## Value functions

- ▶ Executing policy  $\pi \rightarrow$  sequence of states (and rewards).
- ▶ Utility of a state sequence.
  - ▶ But actions are unreliable - environment is stochastic.
  - ▶ Expected return of a policy  $\pi$ .

Starting at time  $t$ , i.e.  $S_t$ ,

$$U^\pi(S_t) = E^\pi \left[ \sum_{k=0}^{\infty} \gamma^k R_{t+k+1} \right]$$

### Value function

$$v^\pi(s) = E^\pi [G_t \mid S_t = s] = E^\pi \left[ \sum_{k=0}^{\infty} \gamma^k R_{t+k+1} \mid S_t = s \right]$$

### Action-value function (q-function)

$$q^\pi(s, a) = E^\pi [G_t \mid S_t = s, A_t = a] = E^\pi \left[ \sum_{k=0}^{\infty} \gamma^k R_{t+k+1} \mid S_t = s, A_t = a \right]$$

## Value functions

- ▶ Executing policy  $\pi \rightarrow$  sequence of states (and rewards).
- ▶ Utility of a state sequence.
- ▶ But actions are unreliable - environment is stochastic.
  - ▶ Expected return of a policy  $\pi$ .

Starting at time  $t$ , i.e.  $S_t$ ,

$$U^\pi(S_t) = E^\pi \left[ \sum_{k=0}^{\infty} \gamma^k R_{t+k+1} \right]$$

### Value function

$$v^\pi(s) = E^\pi [G_t \mid S_t = s] = E^\pi \left[ \sum_{k=0}^{\infty} \gamma^k R_{t+k+1} \mid S_t = s \right]$$

### Action-value function (q-function)

$$q^\pi(s, a) = E^\pi [G_t \mid S_t = s, A_t = a] = E^\pi \left[ \sum_{k=0}^{\infty} \gamma^k R_{t+k+1} \mid S_t = s, A_t = a \right]$$

## Value functions

- ▶ Executing policy  $\pi \rightarrow$  sequence of states (and rewards).
- ▶ Utility of a state sequence.
- ▶ But actions are unreliable - environment is stochastic.
- ▶ **Expected return** of a policy  $\pi$ .

Starting at time  $t$ , i.e.  $S_t$ ,

$$U^\pi(S_t) = \mathbb{E}^\pi \left[ \sum_{k=0}^{\infty} \gamma^k R_{t+k+1} \right]$$

### Value function

$$v^\pi(s) = \mathbb{E}^\pi [G_t \mid S_t = s] = \mathbb{E}^\pi \left[ \sum_{k=0}^{\infty} \gamma^k R_{t+k+1} \mid S_t = s \right]$$

### Action-value function (q-function)

$$q^\pi(s, a) = \mathbb{E}^\pi [G_t \mid S_t = s, A_t = a] = \mathbb{E}^\pi \left[ \sum_{k=0}^{\infty} \gamma^k R_{t+k+1} \mid S_t = s, A_t = a \right]$$

## Optimal policy $\pi^*$ , and optimal value $v^*(s)$

$v^*(s)$  = expected (discounted) sum of rewards (until termination) assuming *optimal* actions.

## Optimal policy $\pi^*$ , and optimal value $v^*(s)$

$v^*(s)$  = expected (discounted) sum of rewards (until termination) assuming *optimal* actions.

# MDP search tree

The value of a  $q$ -state  $(s, a)$ :

$$q^*(s, a) = \sum_{s'} p(s'|a, s) [r(s, a, s') + \gamma v^*(s')]$$

The value of a state  $s$ :

$$v^*(s) = \max_a q^*(s, a)$$

# MDP search tree

The value of a  $q$ -state  $(s, a)$ :

$$q^*(s, a) = \sum_{s'} p(s'|a, s) [r(s, a, s') + \gamma v^*(s')]$$

The value of a state  $s$ :

$$v^*(s) = \max_a q^*(s, a)$$

# MDP search tree

The value of a  $q$ -state  $(s, a)$ :

$$q^*(s, a) = \sum_{s'} p(s'|a, s) [r(s, a, s') + \gamma v^*(s')]$$

The value of a state  $s$ :

$$v^*(s) = \max_a q^*(s, a)$$

## Bellman (optimality) equation

$$v^*(s) = \max_{a \in A(s)} \sum_{s'} p(s'|a, s) [r(s, a, s') + \gamma v^*(s')]$$

$$v^*(s) = \max_{a \in A(s)} \sum_{s'} p(s'|a, s) [r(s, a, s') + \gamma v^*(s')]$$

## Value iteration

- ▶ Start with arbitrary  $V_0(s)$  (except for terminals)
- ▶ Compute Bellman update (one ply of expectimax from each state)

$$V_{k+1}(s) \leftarrow R(s) + \gamma \max_{a \in A(s)} \sum_{s'} p(s'|s, a) V_k(s')$$

- ▶ Repeat until convergence

The idea: Bellman update makes local consistency with the Bellmann equation. Everywhere locally consistent  $\Rightarrow$  globally optimal.

## Value iteration

- ▶ Start with arbitrary  $V_0(s)$  (except for terminals)
- ▶ Compute **Bellman update** (one ply of expectimax from each state)

$$V_{k+1}(s) \leftarrow R(s) + \gamma \max_{a \in A(s)} \sum_{s'} p(s'|s, a) V_k(s')$$

- ▶ Repeat until convergence

The idea: Bellman update makes local consistency with the Bellmann equation. Everywhere locally consistent  $\Rightarrow$  globally optimal.

## Value iteration

- ▶ Start with arbitrary  $V_0(s)$  (except for terminals)

- ▶ Repeat until convergence

The idea: Bellman update makes local consistency with the Bellmann equation. Everywhere locally consistent  $\Rightarrow$  globally optimal.

## Value iteration - Complexity of one estimation sweep

$$V_{k+1}(s) \leftarrow R(s) + \gamma \max_{a \in A(s)} \sum_{s'} p(s'|s, a) V_k(s')$$

A:  $O(AS)$

B:  $O(S^2)$

C:  $O(AS^2)$

D:  $O(A^2S^2)$

# Convergence

$$V_{k+1}(s) \leftarrow R(s) + \gamma \max_{a \in A(s)} \sum_{s'} P(s'|s, a) V_k(s')$$

$$\gamma < 1$$

$$-R_{\max} \leq R(s) \leq R_{\max}$$

Max norm:

$$\|V\| = \max_s |V(s)|$$

$$U([s_0, s_1, s_2, \dots, s_\infty]) = \sum_{t=0}^{\infty} \gamma^t R(s_t) \leq \frac{R_{\max}}{1-\gamma}$$

# Convergence

$$V_{k+1}(s) \leftarrow R(s) + \gamma \max_{a \in A(s)} \sum_{s'} P(s'|s, a) V_k(s')$$

$$\gamma < 1$$

$$-R_{\max} \leq R(s) \leq R_{\max}$$

Max norm:

$$\|V\| = \max_s |V(s)|$$

$$U([s_0, s_1, s_2, \dots, s_\infty]) = \sum_{t=0}^{\infty} \gamma^t R(s_t) \leq \frac{R_{\max}}{1-\gamma}$$

## Convergence cont'd

$V_{k+1} \leftarrow BV_k \dots B$  as the Bellman update  $V_{k+1}(s) \leftarrow R(s) + \gamma \max_{a \in A(s)} \sum_{s'} p(s'|s, a) V_k(s')$

$$\|BV_k - BV'_k\| \leq \gamma \|V_k - V'_k\|$$

$$\|BV_k - V_{\text{true}}\| \leq \gamma \|V_k - V_{\text{true}}\|$$

Rewards are bounded, at the beginning then Value error is

$$\|V_0 - V_{\text{true}}\| \leq \frac{2R_{\text{max}}}{1-\gamma}$$

We run  $N$  iterations and reduce the error by factor  $\gamma$  in each and want to stop the error is below  $\epsilon$ :

$$\gamma^N 2R_{\text{max}} / (1 - \gamma) \leq \epsilon \quad \text{Taking logs, we find: } N \geq \frac{\log(2R_{\text{max}}/\epsilon(1-\gamma))}{\log(1/\gamma)}$$

To stop the iteration we want to find a bound relating the error to the size of *one* Bellman update for any given iteration.

We stop if

$$\|V_{k+1} - V_k\| \leq \frac{\epsilon(1-\gamma)}{\gamma}$$

then also:  $\|V_{k+1} - V_{\text{true}}\| \leq \epsilon$  Proof on the next slide

## Convergence cont'd

$\|V_{k+1} - V_{\text{true}}\| \leq \epsilon$  is the same as  $\|V_{k+1} - V_{\infty}\| \leq \epsilon$

Assume  $\|V_{k+1} - V_k\| = \text{err}$

In each of the following iteration steps we reduce the error by the factor  $\gamma$  (because  $\|BV_k - V_{\text{true}}\| \leq \gamma\|V_k - V_{\text{true}}\|$ ). Till  $\infty$ , the total sum of reduced errors is:

$$\text{total} = \gamma \text{err} + \gamma^2 \text{err} + \gamma^3 \text{err} + \gamma^4 \text{err} + \dots = \frac{\gamma \text{err}}{(1 - \gamma)}$$

We want to have  $\text{total} < \epsilon$ .

$$\frac{\gamma \text{err}}{(1 - \gamma)} < \epsilon$$

From it follows that

$$\text{err} < \frac{\epsilon(1 - \gamma)}{\gamma}$$

Hence we can stop if  $\|V_{k+1} - V_k\| < \epsilon(1 - \gamma)/\gamma$

## Value iteration demo

$$V_{k+1}(s) \leftarrow R(s) + \gamma \max_{a \in A(s)} \sum_{s'} P(s'|s, a) V_k(s')$$

	0	1	2	3	
0	0.81	0.87	0.92	1.00	0
1	0.76		0.66	-1.00	1
2	0.71	0.66	0.61	0.39	2
	0	1	2	3	

# Value iteration algorithm
