# Unreliable actions in observable grid world

- ▶ Walls block movement – agent/robot stays in place.
- ▶ Actions do not always go as planned.
- ▶ Agent receives **rewards** each time step:
  - ▶ Small “living” reward/penalty.
  - ▶ Big rewards/penalties at the end.
- ▶ **Goal:** maximize sum of (discounted) rewards

# MDPs recap

Markov decision processes (MDPs):

- ▶ Set of states  $\mathcal{S}$
- ▶ Set of actions  $\mathcal{A}$
- ▶ Transitions  $p(s'|s, a)$  or  $T(s, a, s')$
- ▶ Rewards  $r(s, a, s')$ ; and discount  $\gamma$

MDP quantities:

- ▶ Policy  $\pi(s) : \mathcal{S} \rightarrow \mathcal{A}$
- ▶ Utility – sum of (discounted) rewards.
- ▶ Values – expected future utility from a state (max-node),  $v(s)$
- ▶ Q-Values – expected future utility from a  $q$ -state (chance-node),  $q(s, a)$

# MDPs recap

## Markov decision processes (MDPs):

- ▶ Set of states  $\mathcal{S}$
- ▶ Set of actions  $\mathcal{A}$
- ▶ Transitions  $p(s'|s, a)$  or  $T(s, a, s')$
- ▶ Rewards  $r(s, a, s')$ ; and discount  $\gamma$

## MDP quantities:

- ▶ Policy  $\pi(s) : \mathcal{S} \rightarrow \mathcal{A}$
- ▶ Utility – sum of (discounted) rewards.
- ▶ Values – expected future utility from a state (max-node),  $v(s)$
- ▶ Q-Values – expected future utility from a  $q$ -state (chance-node),  $q(s, a)$

# Optimal quantities

- ▶ The optimal policy:  $\pi^*(s)$  – optimal action from state  $s$
- ▶ Expected utility/return of a policy.

$$U^\pi(S_t) = E^\pi \left[ \sum_{k=0}^{\infty} \gamma^k R_{t+k+1} \right]$$

Best policy  $\pi^*$  maximizes above.

- ▶ The value of a state  $s$ :  $v^*(s)$  – expected utility starting in  $s$  and acting optimally.
- ▶ The value of a  $q$ -state  $(s, a)$ :  $q^*(s, a)$  – expected utility having taken  $a$  from state  $s$  and acting optimally thereafter.

# Optimal quantities

- ▶ The optimal policy:  $\pi^*(s)$  – optimal action from state  $s$
- ▶ Expected utility/return of a policy.

$$U^\pi(S_t) = E^\pi \left[ \sum_{k=0}^{\infty} \gamma^k R_{t+k+1} \right]$$

Best policy  $\pi^*$  maximizes above.

- ▶ The value of a state  $s$ :  $v^*(s)$  – expected utility starting in  $s$  and acting optimally.
- ▶ The value of a  $q$ -state  $(s, a)$ :  $q^*(s, a)$  – expected utility having taken  $a$  from state  $s$  and acting optimally thereafter.

# Optimal quantities

- ▶ The optimal policy:  $\pi^*(s)$  – optimal action from state  $s$
- ▶ Expected utility/return of a policy.

$$U^\pi(S_t) = E^\pi \left[ \sum_{k=0}^{\infty} \gamma^k R_{t+k+1} \right]$$

Best policy  $\pi^*$  maximizes above.

- ▶ The value of a state  $s$ :  $v^*(s)$  – expected utility starting in  $s$  and acting optimally.
- ▶ The value of a  $q$ -state  $(s, a)$ :  $q^*(s, a)$  - expected utility having taken  $a$  from state  $s$  and acting optimally thereafter.

$v^*$  and  $q^*$

The value of a  $q$ -state  $(s, a)$ :

$$q^*(s, a) = \sum_{s'} p(s'|a, s) [r(s, a, s') + \gamma v^*(s')]$$

The value of a state  $s$ :

$$v^*(s) = \max_a q^*(s, a)$$

$v^*$  and  $q^*$

The value of a  $q$ -state  $(s, a)$ :

$$q^*(s, a) = \sum_{s'} p(s'|a, s) [r(s, a, s') + \gamma v^*(s')]$$

The value of a state  $s$ :

$$v^*(s) = \max_a q^*(s, a)$$

$v^*$  and  $q^*$

The value of a  $q$ -state  $(s, a)$ :

$$q^*(s, a) = \sum_{s'} p(s'|a, s) [r(s, a, s') + \gamma v^*(s')]$$

The value of a state  $s$ :

$$v^*(s) = \max_a q^*(s, a)$$

Maze:  $V_0 = [0, 0, 0]^T$ ,  $r(s) = -1$ , deterministic robot,  $\mathcal{A} = \{\leftarrow, \uparrow, \downarrow, \rightarrow\}$ ,  
 $\gamma = 1$

Sweep is meant as the Bellman update for all states:  $V_1^* = BV_0^*$ .  $r(s) = -1$ . Assume sync version of the algorithm.

A:  $V_1^* = [-1, -1, 9]^\top$

B:  $V_1^* = [0, 8, 9]^\top$

C:  $V_1^* = [-1, 0, 0]^\top$

D:  $V_1^* = [-11, 8, 9]^\top$

What will be  $V^*$  after second sweep?  $V_2^* = [v_2^*(1), v_2^*(2), v_2^*(3)]^\top$ ?

-10.00	0.00	0.00	0.00	10.00
--------	------	------	------	-------

Pick the option which is *wrong*:

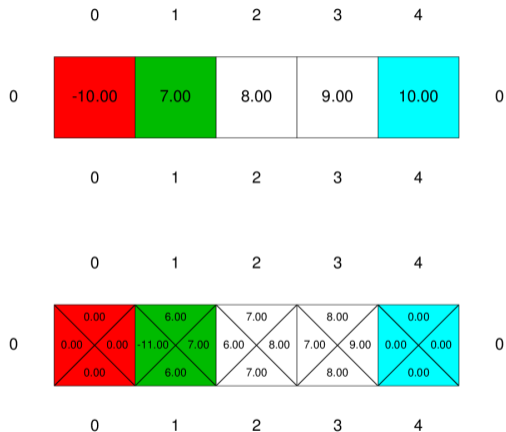

A:  $q^*(1, \uparrow) = -2$

B:  $q^*(1, \rightarrow) = -2$

C:  $q^*(2, \rightarrow) = -2$

D:  $q^*(3, \leftarrow) = -2$

# Maze: $v^*$ vs. $q^*$ , deterministic robot, $\mathcal{A} = \{\leftarrow, \uparrow, \downarrow, \rightarrow\}$

$$q^*(s, a) = \sum_{s'} p(s'|a, s) [r(s, a, s') + \gamma v^*(s')]$$

$$v^*(s) = \max_a q^*(s, a)$$

Maze:  $v^*$  vs.  $q^*$ ,  $\gamma = 1$ ,  $T = [0.8, 0.1, 0.1, 0]$

$$q^*(s, a) = \sum_{s'} p(s'|a, s) [r(s, a, s') + \gamma v^*(s')]$$

$$v^*(s) = \max_a q^*(s, a)$$

# Value iteration

- ▶ Bellman equations **characterize** the optimal values

$$v^*(s) = \max_{a \in A(s)} \sum_{s'} p(s'|s, a) [r(s, a, s') + \gamma v^*(s')]$$

- ▶ Value iteration **computes** them:

$$V_{k+1}(s) \leftarrow \max_{a \in A(s)} \sum_{s'} p(s'|s, a) [r(s, a, s') + \gamma V_k(s')]$$

Value iteration is a fixed point solution method.

## Convergence

$$V_{k+1}(s) \leftarrow \max_{a \in A(s)} \sum_{s'} p(s'|s, a) [r(s, a, s') + \gamma V_k(s')]$$

- ▶ Thinking about special cases: deterministic world,  $\gamma = 0$ ,  $\gamma = 1$ .
- ▶ For all  $s$ ,  $V_k(s)$  and  $V_{k+1}(s)$  can be seen as expectimax search trees of depth  $k$  and  $k + 1$

# From Values to Policy

# Policy extraction - computing actions from Values

- ▶ Assume we have  $v^*(s)$
- ▶ What is the optimal action?

▶ We need a one-step expectimax:

	0	1	2	3	
0	0.81	0.87	0.92	1.00	0
1	0.76		0.66	-1.00	1
2	0.71	0.66	0.61	0.39	2
	0	1	2	3	

$$\pi^*(s) = \arg \max_{a \in \mathcal{A}(s)} \sum_{s'} p(s' | s, a) [r(s, a, s') + \gamma v^*(s')]$$

# Policy extraction - computing actions from Values

	0	1	2	3	

## What is wrong with the Value iteration?

$$V_{k+1}(s) \leftarrow \max_{a \in \mathcal{A}(s)} \sum_{s'} p(s' | s, a) [r(s, a, s') + \gamma V_k(s')]$$

- ▶ What is complexity of one iteration - over all  $S$  states?
- ▶ When does the iteration stop?
- ▶ When does the **policy** converge?
- ▶ Can we compute the policy directly?

# Policy evaluation

- ▶ Assume  $\pi(s)$  given.
- ▶ How to evaluate (compare)?

## Fixed policy, do what $\pi$ says

- ▶ Expectimax trees “max” over all actions ...
- ▶ Fixed  $\pi$  for each state  $\rightarrow$  no “max” operator!

## Fixed policy, do what $\pi$ says

- ▶ Expectimax trees “max” over all actions ...
- ▶ Fixed  $\pi$  for each state  $\rightarrow$  no “max” operator!

## State values under a fixed policy

- ▶ Expectimax trees “max” over all actions ...
- ▶ Fixed  $\pi$  for each state  $\rightarrow$  no “max” operator!

$$v^\pi(s) = \sum_{s'} p(s' | s, \pi(s)) [r(s, \pi(s), s') + \gamma v^\pi(s')]$$

## How to compute $v^\pi(s)$ ?

$$v^\pi(s) = \sum_{s'} p(s' | s, \pi(s)) [r(s, \pi(s), s') + \gamma v^\pi(s')]$$

## Policy iteration

- ▶ Start with a random policy.
- ▶ Step 1: Evaluate it.
- ▶ Step 2: Improve it.
- ▶ Repeat steps until **policy** converges.

# Policy iteration

- ▶ **Policy  $\pi$  evaluation.** Solve equations or iterate until convergence.

$$V_{k+1}^{\pi_i}(s) \leftarrow \sum_{s'} p(s' | s, \pi(s)) [r(s, \pi(s), s') + \gamma V_k^{\pi_i}(s')]$$

- ▶ **Policy improvement.** Look-ahead and keep optimality. Policy extraction from fixed values.

$$\pi_{i+1}(s) = \arg \max_{a \in \mathcal{A}(s)} \sum_{s'} p(s' | s, a) [r(s, a, s') + \gamma V_k^{\pi_i}(s')]$$

## Policy iteration algorithm

**function** POLICY-ITERATION(env) **returns:** policy  $\pi$

**input:** env - MDP problem

$\pi(s) \leftarrow$  random  $a \in A(s)$  in all states

$V(s) \leftarrow 0$  in all states

**repeat**

▷ iterate values until no change in policy

$V \leftarrow$  POLICY-EVALUATION( $\pi, V, \text{env}$ )

unchanged  $\leftarrow$  True

**for each** state  $s$  **in**  $S$  **do**

**if**  $\max_{a \in A(s)} \sum_{s'} P(s'|a, s) V(s') > \sum_{s'} P(s'|s, \pi(s)) V(s')$  **then**

$\pi(s) \leftarrow \arg \max_{a \in A(s)} \sum_{s'} P(s'|a, s) V(s')$

unchanged  $\leftarrow$  False

**end if**

**end for**

**until** unchanged

**end function**

# Policy vs. Value iteration

- ▶ Value iteration.
  - ▶ Iteration updates values and policy. (policy only implicitly – can be extracted from values)
  - ▶ No track of policy.
- ▶ Policy iteration.
  - ▶ Update of values is faster – only one action per state.
  - ▶ New policy from values (slower).
  - ▶ New policy is better or done.
- ▶ Both methods belong to Dynamic programming realm.

# Policy vs. Value iteration

  - ▶ New policy from values (slower).
  - ▶ New policy is better or done.
- ▶ Both methods belong to **Dynamic programming** realm.

## References

Further reading: Chapter 17 of [1] however, policy iteration is quite compact there. More detailed discussion can be found in chapter Dynamic programming in [2] with slightly different notation, though. This lecture has been also greatly inspired by the 9th lecture of CS 188 at <http://ai.berkeley.edu> as it convincingly motivates policy search and offers an alternative convergence proof of the value iteration method.
