# Quest to design intelligent machine Search, Decisions, Games, Learning, ... 

Tomáš Svoboda, Petr Pošík, Jana Kostlivá, Zdeněk Straka, Martin Pecka, B3B33KUI 2021/2022

## Course target: goal-directed system

Pask, Gordon (1972). "Cybernetics". Encyclopædia Britannica.

## cybernetics now

## cybernetics now

- our motivation from (intelligent) robotics
- yet basic concepts from cybernetics
- modern terminology will be used
where we stand 50 years later: machine control in unstructured environment

## State cost/value: $f\left(S_{t}\right)=g\left(S_{t}\right)+h\left(S_{t}\right)$

Backward value/cost, accumulates as it goes $g\left(S_{t}\right)=g\left(S_{t-1}\right)+c\left(S_{t-1}, S_{t}\right)$ $g(C)=g(A)+c(A, C)$

Forward cost, guess of $h\left(S_{t}\right) \approx c\left(S_{t}, G\right)$

## Maximize sum of (expected) rewards, Value iteration:

## Eval（state）

| 䟱 |  | 宔 |  | $\stackrel{\infty}{\circ}$ |  | 4 | 单 |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 8 | 8 | 8 |  |  |  | 8 | 1 |  |
|  |  |  | 8 |  |  |  |  |  |
|  |  |  |  | 8 |  |  |  |  |
|  |  |  | \％ | 8 |  |  |  |  |
|  |  | G |  |  |  |  |  |  |
| $\xi$ | 8 | 8 |  |  |  | 雨 |  |  |
| 号 |  |  | 药号 | \％ |  |  |  |  |

- Uncertain outcome of an action.
- Robot/Agent may not know the current state!

## What state (disease) given some observation (symptoms)?

## $P($ disease $\mid$ symptoms $)=\frac{P(\text { symptoms } \mid \text { disease }) \times P(\text { disease })}{P(\text { symptoms })}$ <br> posterior $=\frac{\text { likelihood } \times \text { prior }}{\text { evidence }}$

For each of the 9 possible situations ( 3 possible decisions $\times 3$ possible states), the cost is quantified by a loss function $I(d, s)$ :

$$
\begin{array}{r|ccc}
l(s, d) & d=\text { nothing } & d=\text { pizza } & d=\text { g.T.c. } \\
\hline s=\text { good } & 0 & 2 & 4 \\
s=\text { average } & 5 & 3 & 5 \\
s=\text { bad } & 10 & 9 & 6
\end{array}
$$

The wife's state of mind is an uncertain state.

| $P(x, s)=P(s \mid x) P(x)$ | $P(x, s)$ |  | $x=$ mild | d $x=$ irritated | d $x=u p s e t$ | $x=$ alarming |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $s=g o$ |  | 0.35 | 0.28 | 0.07 | 0.00 |
|  | $s=$ avera |  | 0.04 | 0.10 | 0.04 | 0.02 |
|  | $s=b$ |  | 0.00 | 0.02 | 0.05 | 0.03 |
| ${ }_{s}$ | $\delta(x)$ |  | = mild $x$ | $x=$ irritated | $x=$ upset $\quad x$ | $x=$ alarming |
|  | $\delta_{1}(x)=$ |  | thing | nothing | pizza | g.T.c. |
|  | $\delta_{2}(x)=$ |  | thing | pizza | g.T.c. | g.T.c. |
|  | $\delta_{3}(x)=$ |  | T.c. | g.T.c. | g.T.c. | g.T.c. |

## Classification as a special case of statistical decision theory

- Attribute vector $\vec{x}=\left[x_{1}, x_{2}, \ldots\right]^{\top}$ : pixels $1,2, \ldots$.
- State set $\mathcal{S}=$ decision set $\mathcal{D}=\{0,1, \ldots 9\}$.
- State $=$ actual class, Decision $=$ recognized class
- Loss function: $I(s, d)= \begin{cases}0, & d=s \\ 1, & d \neq s\end{cases}$

Optimal decision strategy:

$$
\delta^{*}(\vec{x})=\arg \min _{d} \sum_{s} \underbrace{I(s, d)}_{0 \text { if } d=s} P(s \mid \vec{x})=\arg \min _{d} \sum_{s \neq d} P(s \mid \vec{x})
$$

Obviously $\sum_{s} P(s \mid \vec{x})=1$, then: $P(d \mid \vec{x})+\sum_{s \neq d} P(s \mid \vec{x})=1$ Inserting into above:

$$
\delta^{*}(\square)=\arg \max _{d} P(d
$$

$$
\delta^{*}(\vec{x})=\arg \min _{d}(1-P(d \mid \vec{x}))=\arg \max _{d} P(d \mid \vec{x})
$$

## $K-$ Nearest Neighbor and Bayes $j^{*}=\operatorname{argmax}_{j} P\left(s_{j} \mid \mathbf{x}\right)$

Assume data:

- $N$ points x in total.
- $N_{j}$ points in $s_{j}$ class. Hence, $\sum_{j} N_{j}=N$.

We want to classify $\mathbf{x}$. Draw a sphere centered at $\mathbf{x}$ containing $K$ points irrespective of class. $V$ is the volume of this sphere. $P\left(s_{j} \mid \mathbf{x}\right)=$ ?

$$
P\left(s_{j} \mid \mathbf{x}\right)=\frac{P\left(\mathbf{x} \mid s_{j}\right) P\left(s_{j}\right)}{P(\mathbf{x})}
$$

$K_{j}$ is the number of points of class $s_{j}$ among the $K$ nearest neighbors.

$$
\begin{aligned}
P\left(s_{j}\right) & =\frac{N_{j}}{N} \\
P(\mathbf{x}) & =\frac{K}{N V} \\
P\left(\mathbf{x} \mid s_{j}\right) & =\frac{K_{j}}{N_{j} V} \\
P\left(s_{j} \mid \mathbf{x}\right) & =\frac{P\left(\mathbf{x} \mid s_{j}\right) P\left(s_{j}\right)}{P(\mathbf{x})}=\frac{K_{j}}{K}
\end{aligned}
$$

- Usually, we are not given $P(s \mid \vec{x})$
- It has to be estimated from already classified examples - training data
- For discrete $\vec{x}$, training examples $\left(\vec{x}_{1}, s_{1}\right),\left(\vec{x}_{2}, s_{2}\right), \ldots\left(\vec{x}_{l}, s_{l}\right)$
- every $\left(\vec{x}_{i}, s\right)$ is drawn independently from $P(\vec{x}, s)$, i.e. sample $i$ does not depend on $1, \cdots, i-1$
- so-called i.i.d (independent, identically distributed) multiset
- Without knowing anything about the distribution, a non-parametric estimate:

$$
P(s \mid \vec{x})=\frac{P(\vec{x}, s)}{P(\vec{x})} \approx \frac{\# \text { examples where } \vec{x}_{i}=\vec{x} \text { and } s_{i}=s}{\# \text { examples where } \vec{x}_{i}=\vec{x}}
$$

- In the exceptional case of statistical independence between components of $\vec{x}$ for each class $s$ it holds

$$
P(\vec{x} \mid s)=P(x[1] \mid s) \cdot P(x[2] \mid s) \cdot \ldots
$$

- Use simple Bayes law and maximize:

$$
P(s \mid \vec{x})=\frac{P(\vec{x} \mid s) P(s)}{P(\vec{x})}=\frac{P(s)}{P(\vec{x})} P(x[1] \mid s) \cdot P(x[2] \mid s) \cdot \ldots=
$$

## Discriminant functions

$\delta(\mathbf{x})=\operatorname{argmax}_{s \in S} f_{s}(\mathbf{x})$

Discriminant functions for 2 classes:

$$
\begin{aligned}
f_{F}(x) & =a_{F} x+b_{F}= \\
& =e_{F} x-\frac{1}{2} e_{F}^{2}=140 x-9800 \\
f_{M}(x) & =a_{M} x+b_{M}= \\
& =e_{M} x-\frac{1}{2} e_{M}^{2}=180 x-16200
\end{aligned}
$$

A single discriminant function separating 2 classes:

$$
\begin{aligned}
g(x) & =f_{F}(x)-f_{M}(x)= \\
& =-40 x+6400
\end{aligned}
$$

$$
g(\mathbf{x})=\mathbf{w}^{\top} \mathbf{x}+w_{0}
$$

Decide $s_{1}$ if $g(\mathbf{x})>0$ and $s_{2}$ if $g(\mathbf{x})<0$

## Gradient descent

Initialize $\mathbf{w}$, threshold $\theta$, learning rate $\alpha$
$k \leftarrow 0$

## repeat

$k \leftarrow k+1$
$\mathbf{w} \leftarrow \mathbf{w}-\alpha(k) \nabla J(\mathbf{w})$
until $|\alpha(k) \nabla J(\mathbf{w})|<\theta$
return w

## What next?
