

1 Introduction

1.1 About Course

Course Organization

<https://cw.fel.cvut.cz/wiki/courses/b4m36osw>

1.2 Motivation

1.2.1 Scenario 1: What is a dataset about?

What is inside a dataset?

_id	building name	...
3	Atrium Flora	...
...

?

Are there **bus stops** or **large stores** in this dataset?

See OpenData portal of Prague OpenData portal of Prague

What is a building?

Building is a construction

- both above and below ground
- spatially compact
- with walls and roof
- with heating

Act 406/2000 Coll., on Energy Management

Building is a construction

- above ground
- with solid foundations
- spatially compact
- with walls and roof

Act 256/2013 Coll, Cadastral Law

1 Introduction

But things are worse ...

What is a building?

1. ... is a **construction** which is **heated**.

2. ... is a **construction** to provide **protection** to their users or internal equipment and is typically **closed** and has a **permanent position**.

ČSN EN 15643-5 -Sustainability of construction works

Building

3. ... is a **construction above ground** which is **spatially-compact** and **closed by walls and roof**.

Act 256/2013 Coll., Cadastral Law

4. ... is a **construction above and below ground** which is **spatially-compact** and **closed by walls and roof** and is **heated or cooled**.

Act 406/2000 Coll., on Energy Management

What is a building?

ČSN EN 15643-5 - Sustainability of construction works

Building

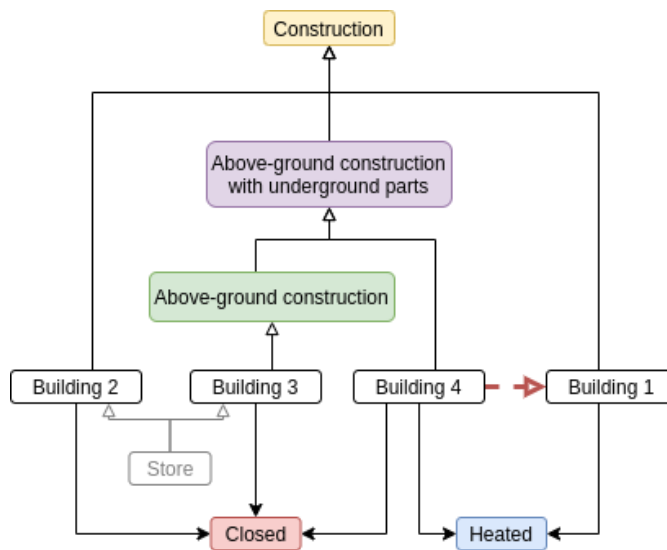

Act 256/2013 Coll., Cadastral Law

Act 406/2000 Coll., on Energy Management

New knowledge can be inferred

1.2.2 Scenarios: Examples of misunderstanding

One event or two events?

DID YOU KNOW

Awaken the mind.

Just months before 9/11, the World Trade Center's lease was privatized and sold to Larry Silverstein.

Silverstein took out an insurance plan that 'fortuitously' covered terrorism.

After 9/11, Silverstein took the insurance company to court, claiming he should be paid double because there were 2 attacks.

Silverstein won, and was awarded \$4,550,000,000.

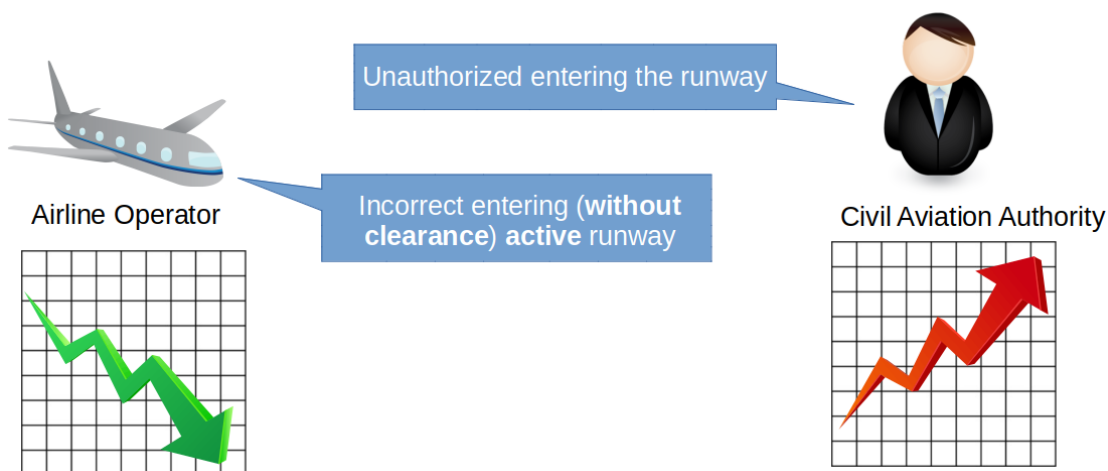

What is an event ? How many events occurred at 9/11 – One or Two ?

Knowledge Management

9/11 ... matter of billions of USD

source:<https://www.metabunk.org/larry-silversteins-9-11-insurance.t2375>

What is the trend of Runway Incursion incidents at an airline operator ?

1.2.3 From Conceptual Models to Ontologies

Ontological Conceptual Modeling

- a way to **capture** and **explain** meaning.
- the language must be understandable to non-experts (UML max)
- the language must be computable – we want to use the models to infer new knowledge or validate data

About ontologies

Ontologies are **formal specifications of conceptualization**.

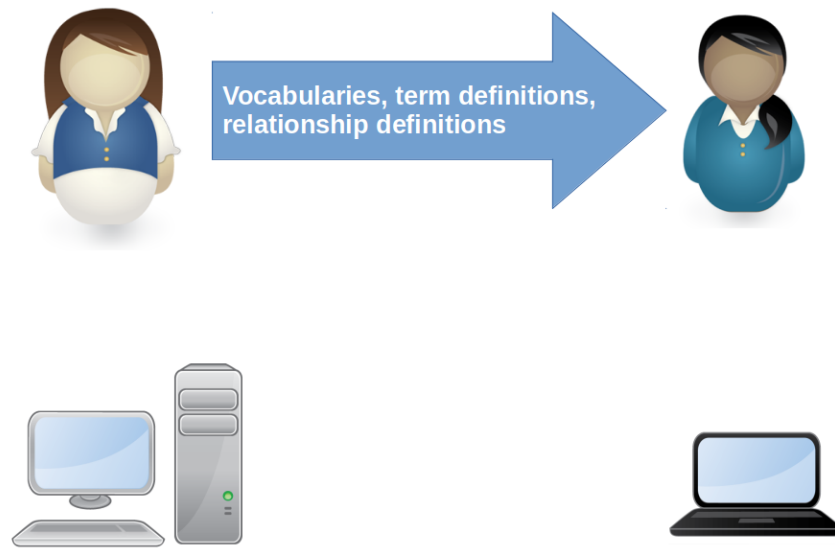

Ontologies help to stabilize the knowledge, to share meaning both among computers and among people. Use-cases include

- Data Integration
- Semantic Web
- Open (Linked) Data

1.3 Overview of Ontologies

First, People Need to Understand Each Other

1 Introduction

Second, People Need to Explain Things to Computers

Third, Computers Can Understand One Another

Solution = Ontology

Explicit Conceptualization of Shared Meaning

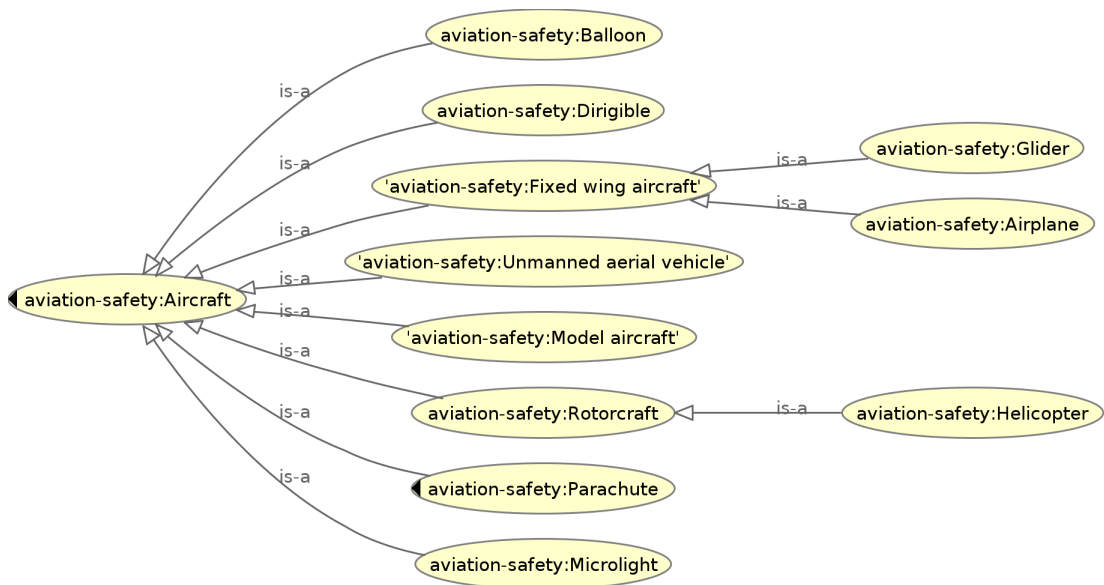

Example Top-Level Ontology

Small part of Unified Foundational Ontology (UFO)

Example Ontology Hierarchy

Each helicopter is also an aircraft.

Ontologies ≠ Taxonomies

Taxonomies = just a single type of relationship.

Construction

→ broad meaning (object, construction site, process)

Dam

House

→ broad meaning (dwelling, construction)

Door → specific meaning (not type of house, but its part)

1.4 Use-case: Data Integration

Data Integration Scenario

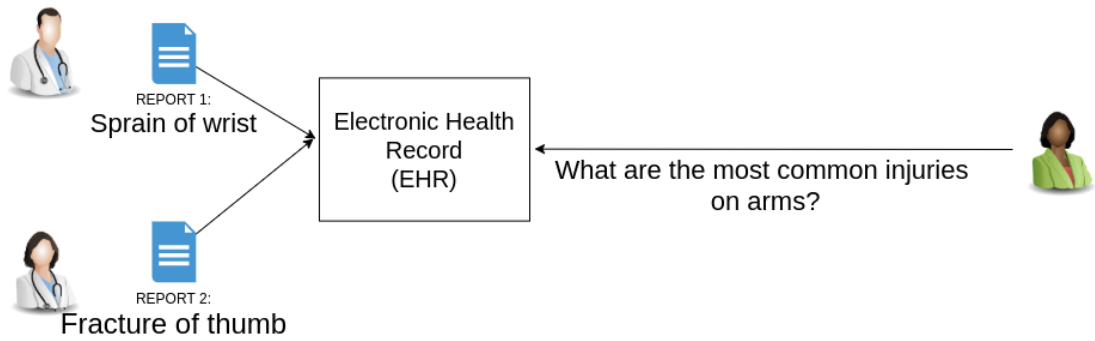

Data Integration Scenario

1 Introduction

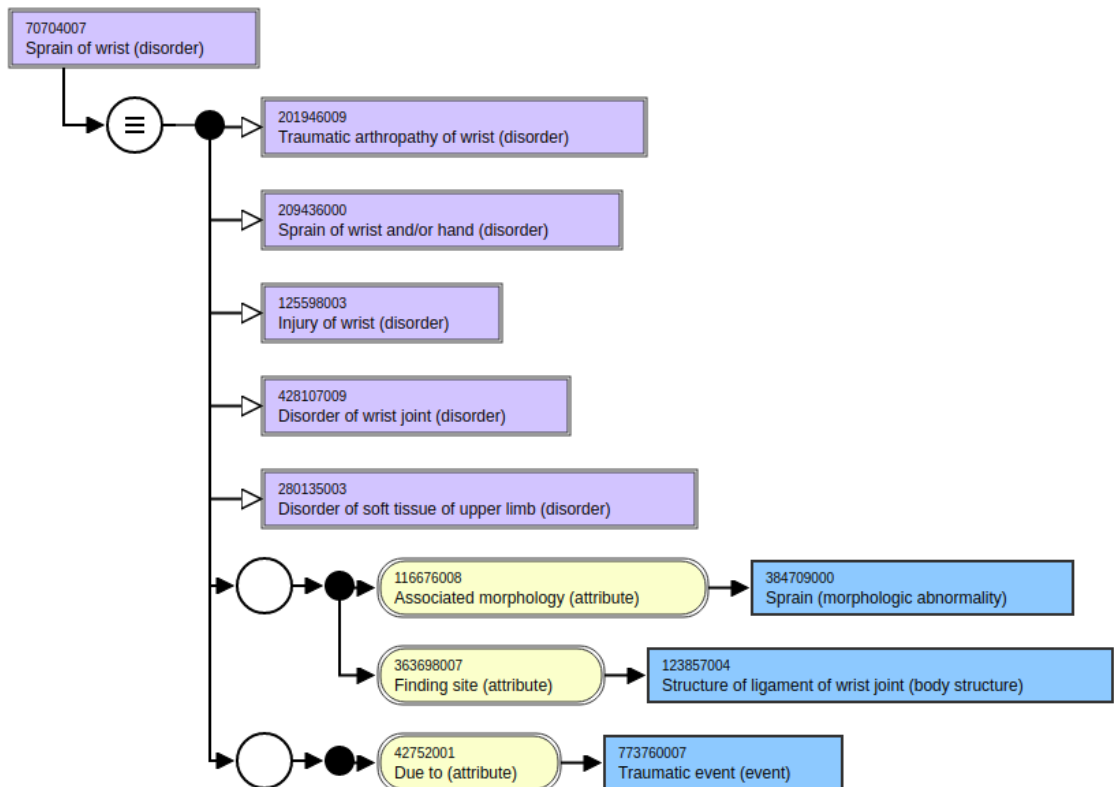

Use-case – HealthCare Data Integration

SNOMED-CT

Systematized Nomenclature of Medicine - Clinical Terms

- ~ 300k clinical concepts
- international standard – adopted e.g. in UK, USA, Australia
- uses ontology reasoning to classify/query the concepts

SNOMED-CT

Systematized Nomenclature of Medicine - Clinical Terms

<https://browser.ihtsdotools.org/?perspective=full&conceptId1=70704007&edition=MAIN/2020-07-31&release=&languages=en>

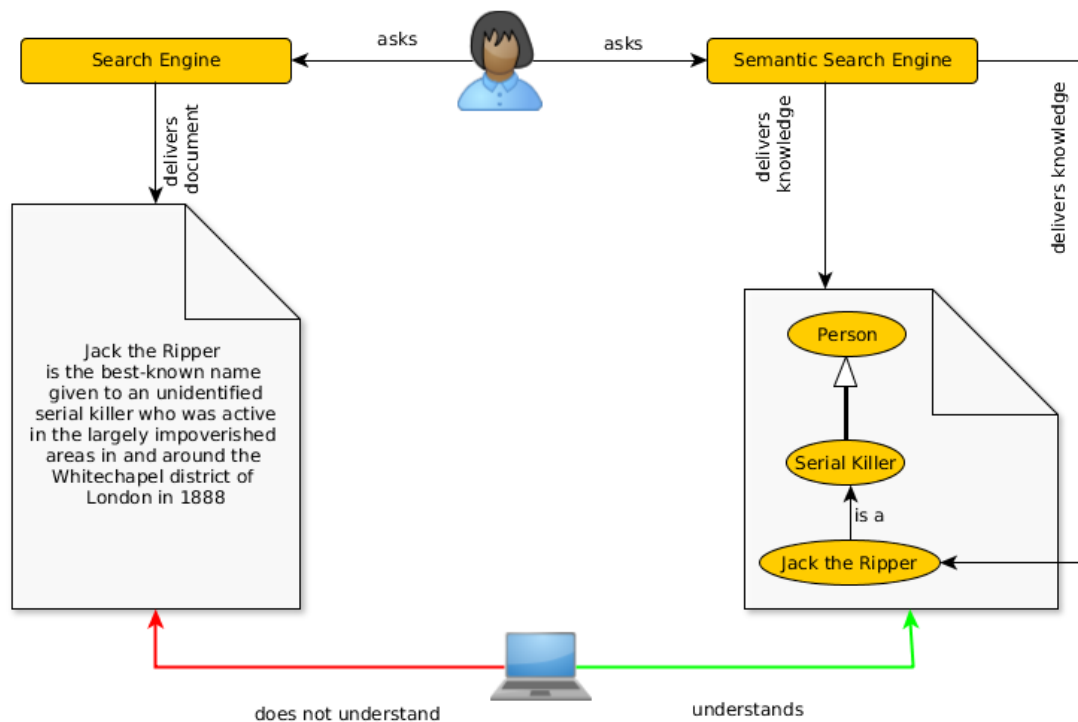

1.5 Semantic Web

Current Web vs. Semantic Web

- SoA – semistructured HTML or XML data. There is vast amount of search engines like Google, Yahoo, MSN, etc. Many of them are invaluable, but as the engines use just keywords and/or some natural language preprocessing methods, the search results contain lots of irrelevant results that need to be processed manually.
- How to make web search more efficient ?
 - more expressive power for web designers to capture complexities – SW languages (RDF(S), OWL),
 - more efficient search engines to handle SW languages – new inference techniques for these languages,
 - better search engines interfaces – more expressive query languages
- **the amount of (unstructured) data is steadily growing**

Semantic search

1 Introduction

Ontologies and Semantic Web

ontology has many definitions, but let's consider it a **formal representation of a complex domain knowledge that is shared with others to ensure intelligent system interoperability,**

semantic web is an extension of the current Web in which information is given well-defined meaning, better enabling computers and people to work in cooperation. (cit. Semantic Web. Tim Berners-Lee, James Hendler and Ora Lassila, Scientific American, 2001)

Idea of Semantic Web

- W3C web page - <http://www.w3.org/2001/sw>
- The data format will be either RDF(S) or OWL,
- Reasoners for RDF(S) can be used for partial derivation in OWL,
- Reasoners for OWL can be used for derivation in RDF(S)

Unique Data Identification – URIs

Semantic web speaks about resources.

URI is a unique identifier for addressing web resources in the form

```
<scheme name> : <hier. part> [ ? <query> ] [ # <fragment> ]
```

. HTTP scheme is used typically.

URN a URI with *scheme name* equal to 'urn'; used e.g. in SWRL atom identification,

URL a URI that can be resolved to a content using the protocol (e.g. HTTP),

IRI generalization of URIs allowing non-ascii characters. IRI is the standard identifier for OWL.

Open World Assumption

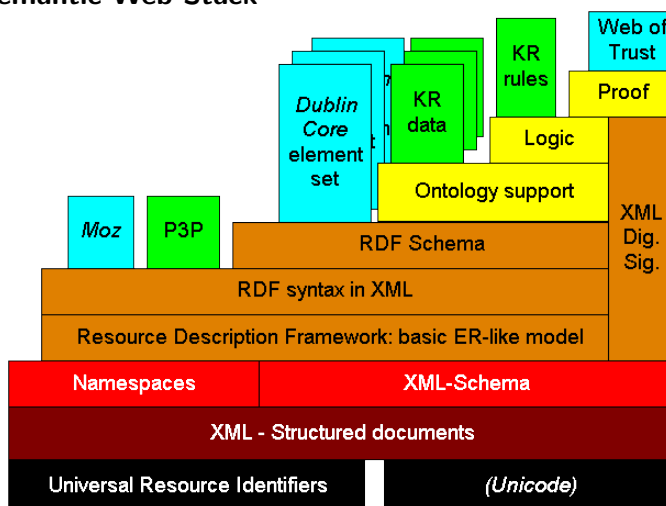

The semantic web inference must take into account that we handle *incomplete knowledge*.

Description

Open world (OWA): Everything that cannot be proven is unknown, Closed world (CWA): Everything that cannot be proven is false.

Statement : “John is a Man.” Query: “Is Jack a Man ?” OWA Answer: “I don’t know.” CWA Answer: “No.”

Semantic Web Stack

Taken from <http://www.w3.org/2000/Talks/0906-xmlweb-tbl/slide9-0.html>, by Tim Berners Lee.

1 Introduction

1.5.1 Semantic Web Adopters

Who is Using Semantic Web Technologies

Let's name a few:

- Google – *Knowledge Graph* (although they do not name it Semantic web – http://semanticweb.com/google-just-hi-jacked-the-semantic-web-vocabulary_b29092)
- Microsoft – Satori, <http://research.microsoft.com/en-us/projects/trinity/query.aspx>
- Facebook – Open Graph Protocol <http://ogp.me/>
- BBC – various datasets in RDF – <http://www.bbc.co.uk/developer/technology/apis.html>
- Ordnance Survey – geographic datasets in RDF – <http://data.ordnancesurvey.co.uk>

BBC Wildlife Ontology

Ordnance Survey Linked Data

Kents Hill, Monkston and Brinklow

Kents Hill, Monkston and Brinklow is a Parish in Milton Keynes.		Core facts about "Kents Hill, Monkston and Brinklow"

		Area Code	CPC
		Gss Code	E04001285

1.6 Linked Data

How to publish data related to other ?

Based on semantic web principles, Linked Data provide means to efficiently connect data created by different publishers.

- Web of Documents – WWW
 - webpage – readable by human
 - identifiers – IRI
 - transfer protocol – HTTP
 - unified language – HTML
- Web of Data – Linked Data
 - webpage – readable by machine
 - identifiers – IRI
 - transfer protocol – HTTP
 - unified language – RDF

1 Introduction

Linked Data [Heath2011] is a method for publishing structured and interlinked data on the web, building up on URIs, HTTP and RDF technologies.

Linked Data Principles

1. Use URIs as names for things.
2. Use HTTP URIs so that people can look up those names.
3. When someone looks up a URI, provide useful information, using the standards (RDF, SPARQL).
4. Include links to other URIs, so that they can discover more things.

(Tim Berners-Lee, 2009 – <http://www.w3.org/DesignIssues/LinkedData.html>)

URIs satisfying the third point are **dereferencable**.

Document vs. its Content

When designing a URI scheme it is necessary to ensure proper distinction between a **document** and its **content**

Example

```
@prefix people: <http://example.com/people/>
people:John people:likes people:Mary
```

Is <http://example.com/people/Mary> a web document or a resource ? (Consider semantic consequences of each option).

This is handled by two strategies – 303 URIs and Hash URIs, each being suitable for different scenarios.

303 URIs

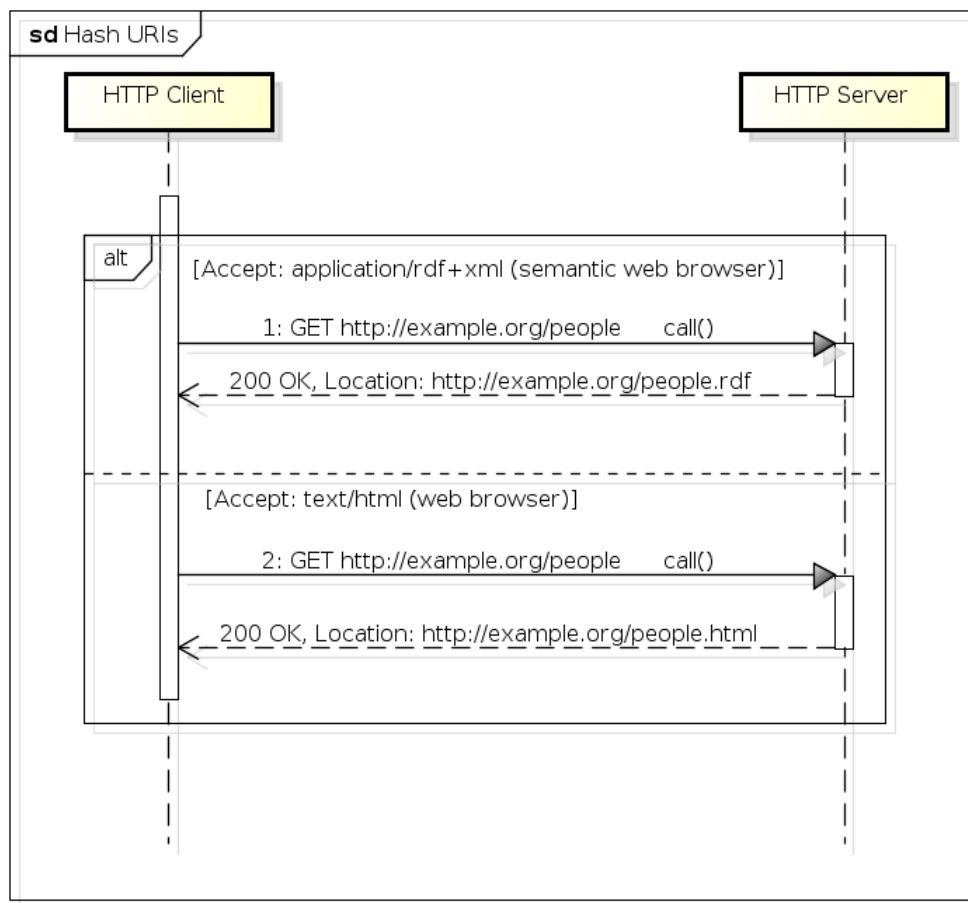

- 303 URIs are of the form <http://id.example.org/people/Alice>
- HTTP server sends 303 redirect to the corresponding **document** of the requested **resource**.
- HTTP client makes another request, based on Accept headers, the RDF/HTML version is delivered.

Hash URIs

- Hash URIs are of the form `http://example.org/people#Alice`
- HTTP server sends the whole **document** of either RDF or HTML type based on Accept headers.
- Within the document, the HTTP client gets the particular entity after the hash symbol.

1 Introduction

powered by Astah

303 URIs vs. Hash URIs

Hash URIs are suitable for small datasets that will hardly grow up,

303 URIs are suitable for large datasets for the sake of good performance.

Reason

The fragment part of an URL (after #) is evaluated on the HTTP client (not the HTTP server), so the HTTP client must fetch all data first and then filter them for the subsequent use locally.

Linked Data Platforms

Pubby is a simple Linked Data publication server connectable to SPARQL endpoints,

Callimachus is an application server for linked data applications. To be explored in the tutorials,

Marmotta is a platform for publishing Linked Data (contributed from Linked Media Framework),

D2R is a platform for publishing relational database data in the form of Linked Data.

1.7 Use-case: Open Data

CKAN and DataHub

CKAN (<http://ckan.org/>) is an open-source data portal for publishing, sharing and search of datasets.

It is prominently hosted at <http://datahub.io>. Datasets on DataHub can be sub-

The screenshot shows the DataHub website interface. At the top, there is a navigation bar with the DataHub logo and the tagline "The easy way to get, use and share data". The main content area is titled "Datasets" and features a search bar with the query "cultural heritage". Below the search bar, it displays "14 datasets found for 'cultural heritage'" and an "Add Dataset" button. The search results are ordered by relevance. The first result is "Swedish Open Cultural Heritage" with a flame icon, described as a set of 3.4 million cultural heritage objects. The second result is "Culture Grid", described as a tool for pulling together information from museum, archive, and library websites. The third result is "Flickr - The Commons", described as a tool for showing hidden treasures in public photography archives. The fourth result is "Amsterdam Museum as Linked Open Data in the Europeana Data Model" with a flame icon, described as a dataset of 70,000 cultural heritage objects. The fifth result is "British Museum Collection" with a flame icon, described as a service providing access to collection data. On the left side of the search results, there are filters for "Organizations" and "Tags". The "Organizations" filter shows 5 items, including "Global (5)", "Linking Open Data C... (2)", "VU University Amste... (1)", "The Getty Trust (1)", "Public Domain (1)", "Open GLAM (1)", "Library Linked Data (1)", "Czech Technical Uni... (1)", and "Civil Society (1)". The "Tags" filter shows 6 items, including "lod (6)", "culturalheritage (6)", "publications (4)", "culture (4)", "cultural (4)", "published-by-producer (3)", "museum (3)", "heritage (3)", "publicdomain (2)", and "package-type.catalog (2)".

mitted to the Linked Data Cloud.

Open Data Levels

Taken from <http://5stardata.info/cs/>.

Open Data Levels – description

- ★ Available on the web (whatever format) but with an open licence, to be Open Data
- ★★ Available as machine-readable structured data (e.g. excel instead of image scan of a table)
- ★★★ All the above, plus – Non-proprietary format (e.g. CSV instead of excel)
- ★★★★ All the above, plus – Use open standards from W3C (RDF and SPARQL) to identify things, so that people can point at your stuff
- ★★★★★ All the above, plus – Link your data to other people’s data to provide context

(Tim Berners-Lee, 2009 – <http://www.w3.org/DesignIssues/LinkedData.html>)

From Open Data to Linked Data (4*)

1 Introduction

From Open Data to Linked Data (5*)

Linked Open Data Cloud

<http://lod-cloud.net/>,2018

1 Introduction

Linked Data vs. Open Data

linked, not open – enterprise data, master data

linked, open – 5* data

not linked, open – typical case in OpenData

not linked, not open – we do not care
