Data Collection Planning with Non-zero Sensing Range - the Traveling

Salesman Problem with Neighborhood

■ The travel cost can be saved by remote data collection using wireless communication

• In addition to Σ , we need to determine n waypoint locations $P = \{ \boldsymbol{p}_1, \dots, \boldsymbol{p}_n \}$

 $\Sigma = (\sigma_1, \dots, \sigma_n), 1 \le \sigma_i \le n, \sigma_i \ne \sigma_j \text{ for } i \ne j$

or range measurements; instead visiting $s \in S$, we can visit p within δ distance from s.

Overview of the Lecture

■ Let each of n sensors $S = \{s_1, \dots, s_n\}$, $s_i \in \mathbb{R}^2$ be associated with a score ζ_i

• The vehicles start at s_1 , terminates at s_n , its travel cost between p_i and p_i is

the Euclidean distance $|(\boldsymbol{p}_i - \boldsymbol{p}_i)|$, and it has limited travel budget T_{max} . ■ The OP stands to determine a subset of k locations $S_k \subseteq S$ maximizing the collected rewards while the tour cost visiting S_k does not exceed T_{max} .

Solve the problem as a regular TSP using centroids of the regions (disks)

• Sample each neighborhood with k samples (e.g., k = 6) and find the

shortest tour by forward search in $O(nk^2)$ for nk^2 edges in the sequence.

• For k possible initial locations, the optimal solution can be found in

shortest possible path/time or under limited travel budget.

problem with profits.

Limited travel budget

■ The Orienteering Problem (OP)

■ We need to prioritize some locations - routing

In both problems, we can improve the solution by exploiting non-zero sensing range.

Orienteering Problem (OP) - Routing with Profits

The OP combines the problem of determining the most valuable locations S_k with finding the

shortest tour T visiting the locations S_k . • Optimal solution (ILP-based) and heuristics have been pro-

Decoupled Approach with Locations Sampling

Data Collection Planning as a Solution of the Routing Problem Provide cost-efficient path to collect all or the most valuable data (measurements) with

- Data Collection Planning as the Traveling Salesman Problem Let S be a set of n sensor locations $S = \{s_1, \dots, s_n\}$, $s_i \in \mathbb{R}^2$ and $c(s_i, s_j)$ is a cost of travel from s_i to s_i .
- The problem is to determine a closed tour visiting each $s \in S$ such that the total tour length is minimal, i.e., determine a sequence of visits $\Sigma = (\sigma_1, \dots, \sigma_n)$.

minimize
$$_{\Sigma}$$

$$L = \left(\sum_{i=1}^{n-1} c(\boldsymbol{s}_{\sigma_i}, \boldsymbol{s}_{\sigma_{i+1}})\right) + c(\boldsymbol{s}_{\sigma_n}, \boldsymbol{s}_{\sigma_1})$$
 subject to $\Sigma = (\sigma_1, \dots, \sigma_n), 1 \le \sigma_i \le n, \sigma_i \ne \sigma_j \text{ for } i \ne j$

to get the sequence of visits Σ .

4-phase heuristic algorithm (Ramesh & Brown, 1991); CGW proposed Chao, et al. 1996;

- Guided local search algorithm (Vansteenwegen et al.
- Standard benchmarks have been established by Tsiligirides and Chao.

Data Collection with Limited Travel Budget OP with Neighborhoods (OPN) and Close Enough OP (CEOP)

- Data collection using wireless data transfer or remote sensing allows to reliably retrieve data within some sensing range δ .
- The OP becomes the Orienteering Problem with Neighborhoods (OPN).
- For the disk-shaped δ -neighborhood, we call it the Close Enough OP (CEOP).
- In addition to S_k and Σ , we need to determine the most suitable waypoint locations P_k that maximize the collected rewards and the path connecting P_k does not exceed Tmax.

 $|(\boldsymbol{p}_{\sigma_i}, s_{\sigma_i})| \le \delta, \quad \boldsymbol{p}_{\sigma_i} \in \mathbb{R}^2$

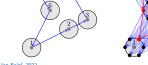

- OPN/CEOP has been firstly tackled by SOM-based approach.
- Later addressed by the GSOA and Variable Neighborhoods Search (VNS)
- and optimal solution of the discrete Set OP.

■ The currently best performing method is based on the Greedy Randomized Adaptive Search Procedure (GRASP).

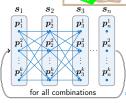

Approaches to the Close Enough TSP and TSP with Neighborhoods

- A direct solution of the TSPN
 - Approximation algorithms for special cases with particular shapes of the neighborhoods. In general, the TSPN is APX-hard, and cannot be approximated to within a factor $2 - \epsilon$, $\epsilon > 0$, unless P=NP. (Safra, S., Schwartz, O. (2006))
 - Heuristic algorithms such as evolutionary techniques or unsupervised learning.
- Decoupled approach
- 1. Determine sequence of visits Σ independently on the locations P. E.g., Solution of the TSP for the centroids of the (convex) neighborhoods.
- 2. For the sequence Σ determine the locations P to minimize the total tour length, e.g.,
 - Solving the Touring polygon problem (TPP);
 - · Sampling possible locations and use a forward search for finding the best locations;
- Continuous optimization such as hill-climbing.
- Sampling-based approaches
 - Sample possible locations of visits within each neighborhood into a discrete set of locations.
 - Formulate the problem as the Generalized Traveling Salesman Problem (GTSP).

 $p_{\sigma_1} = s_1, p_{\sigma_k} = s_n$

Sampling-based Solution of the TSPN

- For an unknown sequence of the visits to the regions, there are $\mathcal{O}(n^2k^2)$ possible edges.
- Finding the shortest path is NP-hard, we need to determine the sequence of visits, which is the solution of the TSP.

Noon, C.E., Bean, J.C.: An efficient transformation of the Systems and Operational Research, 31(1):39–44, 1993. Ben-Arieg, D., Gutin, G., Penn, M., Yeo, A., Zverovitch, A.

Transformation of the GTSP to the Asymmetric TSP The Generalized TSP can be transformed into the Asymmetric TSP that can be then solved,

e.g., by LKH or exactly using Concorde with further transformation of the problem to the TSP

1. Create a zero-length cycle in each set and set all other arcs to ∞ (or 2M).

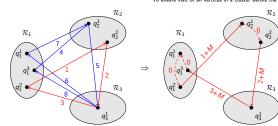

and it is called as the Noon-Bean Transformation.

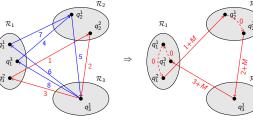

To ensure all vertices of the cluster are visited before leaving the cluster 2. For each edge (q_i^m, q_i^n) create an edge (q_i^m, q_i^{n+1}) with a value increased by sufficiently large M.

Example - Noon-Bean transformation (GATSP to ATSP)

A transformation of the GTSP to the ATSP has been proposed by Noon and Bean in 1993,

To ensure visit of all vertices in a cluster before the next cluster

Generalized Traveling Salesman Problem with Neighborhoods (GTSPN)

- The GTSPN is a multi-goal path planning problem to determine a cost-efficient path to visit a set of 3D regions.
- A variant of the TSPN, where a particular neighborhood may consist of multiple (possibly disjoint) 3D regions.
- Redundant manipulators, inspection tasks with multiple views, multi-goal aircraft missions. Gentilini I et al. (2014)
- Regions are polyhedron, ellipsoid, and combination of both.
- We proposed decoupled approach Centroids-GTSP and GSOA-based methods with post-processing optimization

Faigl I Deckeroyá I and Váňa P. Fast Heuristics for the 3D Multi-Goal Path Planning based on the

Generalized Traveling Salesman Problem (GTSP)

- For sampled neighborhoods into discrete sets of locations, we can formulate the problem as the Generalized Traveling Salesman Problem (GTSP). • For a set of n sets $S = \{S_1, ..., S_n\}$, each
- with particular set of locations (nodes) $S_i =$ $\{s_1^i, \ldots, s_{n_i}^i\}$, determine the shortest tour visiting each set S_i .

 $\sum c(s^{\sigma_i}, s^{\sigma_{i+1}}) + c(s^{\sigma_n}, s^{\sigma_1})$

- $s^{\sigma_i} \in S_{\sigma_i}, S_{\sigma_i} = \{s_1^{\sigma_i}, \dots, s_{n_{\sigma_i}}^{\sigma_i}\}, S_{\sigma_i} \in S$
- Optimal ILP-based solution and heuristic algorithms exists.
 - GLKH http://akira.ruc.dk/~keld/research/GLKH/

1. Create a zero-length cycle in each set and set all other arcs to ∞ (or 2M).

To ensure all vertices of the cluster are visited before leaving the cluster.

To ensure visit of all vertices in a cluster before the next cluster

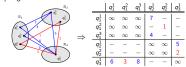

Noon-Bean Transformation

- Noon-Bean transformation to transfer GTSP to ATSP.
- Modify weight of the edges (arcs) such that the optimal ATSP tour visits all vertices of the same cluster before moving to the next cluster.
 - Adding a large a constant M to the weights of arcs connecting the clusters, e.g., a sum of the n
 - heaviest edges. Ensure visiting all vertices of the cluster in prescribed order, i.e., creating zero-length cycles within each cluster
- The transformed ATSP can be further transformed to
 - For each vertex of the ATSP created 3 vertices in the TSP, i.e., it increases the size of the problem

Noon-Bean transformation – Matrix Notation

• 1. Create a zero-length cycle in each set; and 2. for each edge (q_i^m, q_i^n) create an edge (q_i^m, q_i^{n+1}) with a value increased by sufficiently large M.

■ The planning problem is a variant of the Traveling

Two practical aspects of the data collection can be identified. 1. Data from particular sensors may be of different impor-

E.g., Sampling stations on the ocean floor.

These two aspects (of general applicability) can be considered in the Prize-Collecting Trav-

eling Salesman Problem (PC-TSP) and Orienteering Problem (OP) and their extensions

Prize-Collecting Traveling Salesman Problem with Neighborhoods (PC-TSPN)

- Let n sensors be located in \mathbb{R}^2 at the locations $S = \{s_1, \dots, s_n\}$.
- **Each** sensor has associated penalty $\xi(s_i) \geq 0$ characterizing additional cost if the data are not retrieved from s_i .
- Let the data collecting vehicle operates in \mathbb{R}^2 with the motion cost $c(\boldsymbol{p}_1,\boldsymbol{p}_2)$ for all pairs of points $\boldsymbol{p}_1, \boldsymbol{p}_2 \in \mathbb{R}^2$.
- The data from \mathbf{s}_i can be retrieved within δ distance from \mathbf{s}_i .

PC-TSPN - Optimization Criterion

The PC-TSPN is a problem to

Stefaníková, P., Váňa, P., and Faigl, J.: Greedy Ra

- Determine a set of unique locations $P = \{p_1, ..., p_k\}$, $k \le n$, $p_i \in \mathbb{R}^2$, at which data readings are performed.
- Find a cost efficient tour T visiting P such that the total cost C(T) of T is minimal

$$\mathcal{C}(T) = \sum_{(\boldsymbol{p}_{l_i}, \boldsymbol{p}_{l_{i+1}}) \in T} |(\boldsymbol{p}_{l_i} - \boldsymbol{p}_{l_{i+1}})| + \sum_{\boldsymbol{s} \in S \setminus S_T} \xi(\boldsymbol{s}),$$

where $S_T \subseteq S$ are sensors such that for each $\mathbf{s}_i \in S_T$ there is \mathbf{p}_L on $T = (\boldsymbol{p}_{l_1}, \dots, \boldsymbol{p}_{l_{k-1}}, \boldsymbol{p}_{l_k})$ and $\boldsymbol{p}_{l_i} \in P$ for which $|(\boldsymbol{s}_i - \boldsymbol{p}_{l_i})| \leq \delta$.

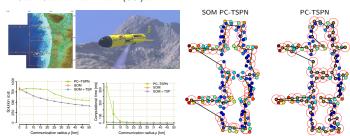

PC-TSPN includes other variants of the TSP:

national Joint Conference on Neural Networks (IJCNN), 2017, pp. 2611-2620.

- for $\delta = 0$ it is the PC-TSP;
- for $\xi(\mathbf{s}_i) = 0$ and $\delta \ge 0$ it is the TSPN:
- for $\xi(\mathbf{s}_i) = 0$ and $\delta = 0$ it is the ordinary TSP.

Summary of the Lecture

Topics Discussed

Topics Discussed

- Data collection planning formulated as variants of
 - Traveling Salesman Problem (TSP)
 Orienteering Problem (OP)

 - Prize-Collecting Traveling Salesman Problem with Neighborhoods (PC-TSPN)
- Exploiting the non-zero sensing range can be addressed as
 TSP with Neighborhoods (TSPN) or specifically as the Close Enough TSP (CETSP) for disk-shaped neighborhoods.

 OP with Neighborhoods (OPN) or the Close Enough OP (CEOP).
- Problems with continuous neighborhoods include continuous optimization that can be addressed by sampling the neighborhoods into discrete sets.

 Generalized TSP and Set OP
- Existing solutions include
 - Approximation algorithms and heuristics (combinatorial, unsupervised learning, evolutionary methods)

 - Sampling-based and decoupled approaches
 ILP formulations for discrete problem variants (sampling-based approaches)
 Transformation based approaches (GTSP—ATSP) / Noon-Bean transformation

 - Combinatorial heuristics such as VNS and GRASP
 - TSP can be solved by efficient heuristics such as LKH
