	Overview of the Lecture	VCS Version Control Systems Git SVN - Subversion Versioning				
Version Control Systems Jan Faigl	Part 1 – Version Control Systems Introduction and Terminology	Part I				
Department of Computer Science Faculty of Electrical Engineering Czech Technical University in Prague Lecture 13 B3B36PRG – C Programming Language	Version Control Systems Git SVN - Subversion Versioning	Part 1 – Version Control Systems (VCSs)				
Jan Faigl, 2021 B3B36PRG – Lecture 13: Version Control Systems 1 / 47 VCS Version Control Systems Git SVN - Subversion Versioning	Jan Faigl, 2021 B3B36PRG – Lecture 13: Version Control Systems 2 / 47 VCS Version Control Systems Git SVN - Subversion Versioning	Jan Faigl, 2021 B3B36PRG – Lecture 13: Version Control Systems 3 / 47 VCS Version Control Systems Git SVN - Subversion Versioning				
What is Version Control?	Version Control System	Benefits of Version Control System (VCS)				
 Working on a project or an assignment, we can tend to "backup" our early achievements mostly "just for sure". hw01 hw01.old hw01.old2 hw01.old3 We may try a new approach, e.g., for optional assignment, but we would like to preserve the previous (working) approach. We may also want to backup the files to avoid file/work lost in a case of hard/solid drive failure. We need to save it to a reliable medium. Finally, we need a way how to distribute and communicate our changes within our development team. An Finil 2021	 Version Control System (VCS) is a tool (or set of tools) providing management of changes to files over time. Uniquely identified changes (what). Time stamps of the changes (when). Author of the changes (when). Author of the changes (when). Manual (by hand), e.g., "save as." Creating multiple copies of files and changes documented in an annotation. Backups of the file systems (e.g., snapshots). Files shared between team members. Automated version control System or application manages changes. Version tracking is managed internally by the system or application. It may provide further support for collaboration (team development). 	 VCS provides numerous benefits for both working environment (individual and team). Individual benefits: Backups with tracking changes; Tagging – marking the particular version in time; Branching – multiple versions; Tracking changes; Revert (undo) changes. Team benefits Working on the same code sources in a team of several developers; Merging concurrent changes; Support for conflicts resolution when the same file (the same part of the file) has been simultaneously changed by several developers; Determine the author and time of the changes. 				
Jain Failg, 2021 DSDSDPRG – Lecture 13: Version Control systems S / 4/ VCS Version Control Systems Git SVN - Subversion Versioning	VCS Version Control Systems Git SVN - Subversion Versioning	VCS Version Control Systems Git SVN - Subversion Versioning				
History Overview 1972 – Source Code Control System (SCCS) Store changes using deltas Keeps multiple versions of a complete directory Keeps original documents and changes from one version to the next 1982 – Revision Control System (RCS) Keeps the current version and applies changes to go back to older versions 	 Revision Control System (RCS) - Commands Create a directory for storing rcs files, e.g., /etc ci file - check in a revision (put the file under rcs control) co -1 file - check out a file and lock it [- I] Locking by means the file can be checked back in rcs -1 file - lock a file already checked out 	Revision_control System (RCS) - Example 2 % of vork 3 % via main.sh 4 % mkdir RCS 5 % cl · u main.sh 6 NCS/main.sh, ··· min.sh 7 NCS/main.sh, ··· min.sh 8 % via for the log messaget 9 >> Ny main script 10 >> . 11 initial revision: 1.1 12 dome 13 % the NCS 14 % schol * Yp script* >> min.sh 16 % reddiff main.sh				
 Reeps the Current Version and applies changes to go back to older versions Single file at a time 1986 – Concurrent Versions Systems (CVS) Start as scripts on top of the RCS Handle multiple files at a time Client-Server architecture 	 rcsdiff files – report on differences between files merge files – merge two files into an original file The results has to be checked, it is not a magic! 	<pre>18</pre>				

VCS Version Control Systems Git SVN -	Subversion Versioning	VCS Version Control Systems Git SVN - Subversion Versioni	ng VCS Version Control Systems Git SVN - S	ubversion Versioning		
Terminology – VCS Vocabulary		Repository and Version Control	Versioning Files			
 Repository – the database storing the files and deltas. Working (Local) copy of the versioned files. User works with a copy of the versioned files to modify them. We can further distinguish local and working copy of the repository (versioned files) for particular working copy also keeps to local copy of the files in the arm directory with the version of the files in the arm directory with the version of the files in the arm directory with the version of the files in the arm directory with the version of the files in the arm directory. Trunk – The primary location for the particular project files in Branch – A secondary code location (for a variant of the projet Revision – A version of the a file (or repository). Commit – Storing a bunch of changes to the repository. Revert – Roll back a commit from the repository. Merge – Pulling changes from one branch into another. Conflict – When a file cannot be merged cleanly (<i>automagical</i>). 	the repository. ct). y).	 Version Control System (VCS) is a set of tools (commands) for interaction with the repository and location files (copies of the versioned files). A tool is a command or "icon" or an "menu item." Local command or in the case of the repository also a server service. Repository All changes are stored in the repository. <i>Usually as deltas, which store differences, and thus save file size.</i> Repository can be remote or local. 	0 17	Local/Working Copy		
Jan Faigl, 2021 B3B36PRG – Lecture 13: Version Control VCS Version Control Systems Git SVN -	I Systems 11 / 47 Subversion Versioning	Jan Faigl, 2021 B3B36PRG – Lecture 13: Version Control Systems 12 / VCS Version Control Systems Git SVN - Subversion Versioni	47 Jan Faigl, 2021 B3B36PRG – Lecture 13: Version Control ng VCS Version Control Systems Git SVN - S	Systems 13 / 47 ubversion Versioning		
Getting Local/Working Copy – checkout		Adding a File to the Version Control – add	Confirm Changes to the Repository – commit	, i i i i i i i i i i i i i i i i i i i		
 Create a local copy of the versioned files from the repository. Directory tree of the local copy usually contains additional files with the information about the versioned files, revisions, and repository, e.g., .git or .svn. Then, by modifying checkouted files, we modify the local copies of the particular version of the files. 	Repository checkout Checkout Local/Working Copy	 It is necessary to inform the version control system to track particular files under version control, e.g., once (svn) or every time a change should be propagated to the repository (git). Without explicit adding files, the VCS does not know which files we would like to keep under version control and which not. add add image: add image: additional system to the system t	 Request to accept the local modifications as a new revision of the files. Version control system creates the closest higher version, e.g., with the revision number increased by one. For the case there is not a newer revision in the repository (according to the local copy of the repository modified locally), changes are propagated to the repository; Otherwise: Update the locally copy of the versioned files to the newer version from the repository. If merges are not handled "automagically", it is necessary to handle conflicts. Notice, each commit should be commented by a meaningful, clear, and not obvious comment. 			
Jan Faigl, 2021 B3B36PRG – Lecture 13: Version Control VCS Version Control Systems Git SVN -	I Systems 14 / 47 Subversion Versioning	Jan Faigl, 2021 B3B36PRG – Lecture 13: Version Control Systems 15 / VCS Version Control Systems Git SVN - Subversion Versioni	VCS Version Control Systems Git SVN - S	Systems 16 / 47 ubversion Versioning		
 Update the Local Version of the Files from the Reposition of the versioned files to a newer (or specified) revision from the repository. If changes of the versioned files is compatible with local modifications, files are <i>automagically</i> merged. Otherwise it is necessary to manage the conflicts and select the correct version manually. 	tory - update Repository	 Resolving Conflicts Manger of the report and the VCS does not prevent the conflicts, but it provides tools for resolving the conflicts. Conflict is usually caused by simultaneous modification of the same part in the source file. Conflicts can be avoided by suitable structure of the source files, using modules, and the overall organization of the project files. Conflicts can be further avoided by specifying access rights to particular files and developers (authorization). It might put different demands on the VCS, e.g., Subversion, Bitkeeper vs. Git. 	<pre>Example of the Merge File with Marked Conflict 1169 fprintf(stdout, "%d [%.31f, %.31f]\n", i, 1170 } 1171 <<<<<< vis.cpp 1172 G=12*cities.number; 1173 //G=12.41*4+0.06; 1174 ======= 1175 G=12.41*cities.number+0.06; 1176 >>>>>> 1.12.2.48 1177 separate = false; 1178 return 0; 1179 } 1180 1181 ///</pre>

an Faigl, 2021 B3B36PRG - Lecture 13: Version Control Systems 27 / 47 Jan Faigl, 2021 B3B36PRG - Lecture 13: Version Control Systems 28 / 47 Jan Faigl, 2021 B3B36PRG - Lecture 13: Version Control Systems 30 / 47	 Every checkout of the repository can be a full repository with complete history. Might be turn to a server based, but with redundant commands. High redundancy with efficient data transfer. Designed for branching and merging repositories. Branches and tags are "markers" of the subset of the repository. Subversion - Central repository approach (primarily) The main repository is the only source that has the complete file history. Users checkout local copies of the current version. Strong support of authorization to particular directories. The revision id is a number for the whole repository. Tags and branches are directories (based on the concept of cheap-copy) Allows easy and straightforward multiple versions (branches/tags) alongside, which is very difficult in Git. What the best fits your needs depends on the way how you expect to use it. It also holds for single user usage. Imagine a situation with a single main laptop (btw. try to never rely on a single HDD/SSD). Or a situation with several workstations and laptops. 	 For both systems Git and Subversion, there are several books also available for download or on-line readings. Git https://git-scm.com/book/en/v2 Subversion http://svnbook.red-bean.com/ https://subversion.apache.org/docs/ 	 DVCS does not necessarily have a central repository. Each developer keeps its own <i>local</i> repository. Branches are usually used very often (locally without interaction to other developers). The final project is a compilation of particular branches by individual developers. Beside Git, there are several another systems: Bazaar - bzr; Monotone - http://www.monotone.ca; SVK - based on Subversion Darcs (darcs) - David's Advanced Revision Control System; http://darcs.net Written in Haskell Mercurial - http://www.selenic.com/mercurial/wiki BitKeeper - http://www.bitkeeper.com. Perforce, Plastic SCM - proprietary software Git - git - created for developing the Linux kernel http://git-scm.com
