

# Problem solving by search

Tomáš Svoboda, Matěj Hoffmann, and Petr Pošík

Vision for Robots and Autonomous Systems, Center for Machine Perception  
Department of Cybernetics  
Faculty of Electrical Engineering, Czech Technical University in Prague

February 20, 2023

# Outline

- ▶ Search problem. *What do you want to solve?*
- ▶ State space graphs. *How do you formalize/represent the problem? Problem abstraction.*
- ▶ Search trees. *Visualization of the algorithm run.*
- ▶ Strategies: which tree branches to choose?
- ▶ Strategy/Algorithm properties. *Memory, time, ...*
- ▶ Programming infrastructure.

## Example: Traveling in Romania

# Traveling Example: State and Actions

Goal:

be in Bucharest

Problem formulation:

states: position in a city (cities)

actions: at a crossing, select a road

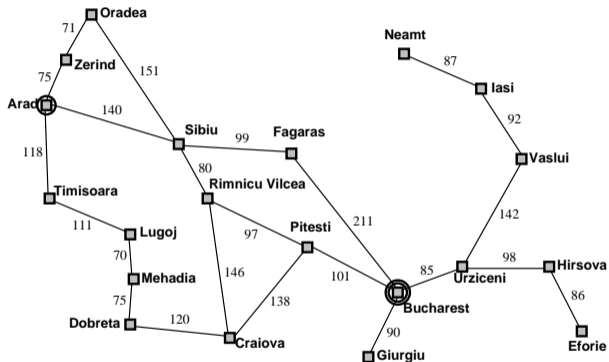

Solution:

Sequence of cities (path)

(action sequence [2])

Cost:

Energy, time, tolls, ...

# Traveling Example: State and Actions

Goal:

be in Bucharest

Problem formulation:

states: position in a city (cities)

actions: at a crossing, select a road

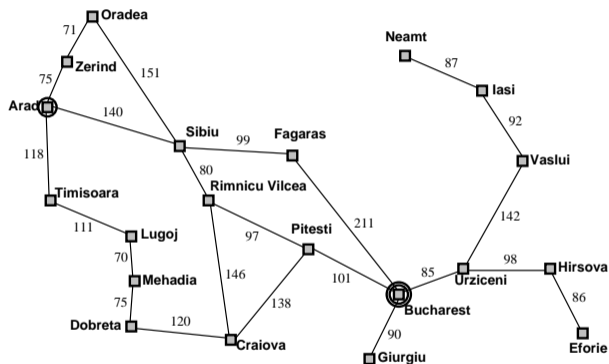

Solution:

Sequence of cities (path)

(action sequence [2])

Cost:

Energy, time, tolls, ...

# Traveling Example: State and Actions

## Example: The 8-puzzle

7	2	4
5		6
8	3	1

Start State

1	2	3
4	5	6
7	8	

Goal State

states?  
actions?  
solution?  
cost?

## Example: Vacuum cleaner

states?  
actions?  
solution?  
cost?

# A Search Problem

- ▶ **State space** (including Start/Initial state): position, board configuration,
- ▶ Actions : drive to, Up, Down, Left ...
- ▶ Transition model : Given state and action return state (and cost)
- ▶ Goal test : Are we done?

# A Search Problem

- ▶ **State space** (including Start/Initial state): position, board configuration,
- ▶ **Actions** : drive to, Up, Down, Left ...
- ▶ Transition model : Given state and action return state (and cost)
- ▶ Goal test : Are we done?

# A Search Problem

- ▶ **State space** (including Start/Initial state): position, board configuration,
- ▶ **Actions** : drive to, Up, Down, Left ...
- ▶ **Transition model** : Given state and action return state (and **cost**)
- ▶ Goal test : Are we done?

# A Search Problem

- ▶ **State space** (including Start/Initial state): position, board configuration,
- ▶ **Actions** : drive to, Up, Down, Left ...
- ▶ **Transition model** : Given state and action return state (and **cost**)
- ▶ **Goal test** : Are we done?

# State Space Graphs

**State space graph:** a representation of a search problem

- ▶ Graph Nodes – states – are abstracted world configurations
- ▶ Arcs represent action results
- ▶ Goal test – a set of goal nodes

Each state occurs only *once* in a state (search) space.

# Search Trees

- ▶ A “what if” tree of plans and their outcomes
- ▶ Start node is the root
- ▶ Children are successors
- ▶ Nodes show/contains states, but correspond to *plans* that achieve those states

## State Space Graphs vs. Search Trees

How big is the search tree?

# From problem/transition graph to search tree (Romania)

(a) The initial state

(b) After expanding Arad

(c) After expanding Sibiu

Problem/transition graph is revealed incrementally.

The revealing strategy can be visualized as a search tree.

## Search elements - unvisited, dead, alive states

### (c) After expanding Sibiu

- ▶ Expand **plans** - possible ways (**tree nodes**).
- ▶ Manage/Maintain **fringe** (or **frontier**) of plans under consideration.
- ▶ Expand new nodes *wisely(?)*.

# Tree search algorithm

(c) After expanding Sibiu

**function** TREE\_SEARCH(problem) **return** a solution or failure

initialize by using the initial state of the problem

**loop**

if no candidates for expansion **then return** failure

else choose a leaf node for expansion

**end if**

if the node contains a goal state **then return** the solution

**end if**

Expand the node and add the resulting nodes to the tree

**end loop**

**end function**

# Tree search algorithm

(c) After expanding Sibiu

**function** TREE\_SEARCH(problem) **return** a solution or failure

initialize by using the initial state of the problem

loop

if no candidates for expansion **then return** failure

else choose a leaf node for expansion

end if

if the node contains a goal state **then return** the solution

end if

Expand the node and add the resulting nodes to the tree

end loop

end function

# Tree search algorithm

(c) After expanding Sibiu

**function** TREE\_SEARCH(problem) **return** a solution or failure

initialize by using the initial state of the problem

**loop**

**if** no candidates for expansion **then** return failure

else choose a leaf node for expansion

end if

if the node contains a goal state **then** return the solution

end if

Expand the node and add the resulting nodes to the tree

end loop

end function

# Tree search algorithm

(c) After expanding Sibiu

**function** TREE\_SEARCH(problem) **return** a solution or failure

initialize by using the initial state of the problem

**loop**

**if** no candidates for expansion **then return** failure

else choose a leaf node for expansion

end if

if the node contains a goal state **then return** the solution

end if

Expand the node and add the resulting nodes to the tree

end loop

end function

# Tree search algorithm

## Search (algorithm) properties

- ▶ Guaranteed to find a solution (if exists)? Complete?
- ▶ Guaranteed to find the least cost path? Optimal?
- ▶ How many steps - an operation with a node? Time complexity?
- ▶ How many nodes to remember? Space/Memory complexity?

How many nodes in a (search) tree? What are tree parameters?

# Strategies

How to traverse/build a search tree?

- ▶ **Depth** of the tree  $d$ .
- ▶ **Max-Depth** of the tree  $m$ . Can be  $\infty$ .
- ▶ **Branching** factor  $b$ .
- ▶  $s$  denotes the **shallowest Goal**.
- ▶ How many nodes in the whole tree?

Do not follow nodes with depth > maxdepth

## DFS with limited depth, maxdepth=2

Do not follow nodes with depth  $>$  maxdepth

## DFS with limited depth, maxdepth=2

Do not follow nodes with depth > maxdepth

## DFS with limited depth, maxdepth=2

Do not follow nodes with depth > maxdepth

## DFS with limited depth, maxdepth=2

Do not follow nodes with depth > maxdepth

## Iterative deepening DFS (ID-DFS)

- ▶ Start with `maxdepth = 1`
  - ▶ Perform DFS with limited depth. Report success or failure.
  - ▶ If failure, forget everything, increase `maxdepth` and repeat DFS

Is it not a terrible waste to forget everything between steps?

## Iterative deepening DFS (ID-DFS)

- ▶ Start with `maxdepth = 1`
- ▶ Perform DFS with limited depth. Report success or failure.
  - ▶ If failure, forget everything, increase `maxdepth` and repeat DFS

Is it not a terrible waste to forget everything between steps?

- ▶ `n.pathcost`

Perhaps we may add something later, if needed ...

## How to organize nodes?

The Python examples are just suggestions, ...

- ▶ A dynamically linked structure (`list()`).
- ▶ Add a node (`list.insert(node)`).
- ▶ Take a node and remove from the structure (`node=list.pop()`).
- ▶ Check the Python modules `heapq`<sup>1</sup> and `queue`<sup>2</sup> for inspiration.

---

<sup>1</sup><https://docs.python.org/3.5/library/heapq.html>

<sup>2</sup><https://docs.python.org/3.5/library/queue.html>

# What is the solution?

- ▶ We stop when **Goal** is reached.
- ▶ How do we construct the **path**?

# Summary

- ▶ State space graph – an abstraction of a search problem.
- ▶ Search tree – visualization of the search algorithm run.
- ▶ Properties of search algorithms.
