Data Collection Planning with Non-zero Sensing Range - the Traveling

Salesman Problem with Neighborhood

■ The travel cost can be saved by remote data collection using wireless communication

• In addition to  $\Sigma$ , we need to determine n waypoint locations  $P = \{ \boldsymbol{p}_1, \dots, \boldsymbol{p}_n \}$ 

$$\begin{split} \Sigma &= (\sigma_1, \dots, \sigma_n), 1 \leq \sigma_i \leq n, \sigma_i \neq \sigma_j \text{ for } i \neq j \\ P &= \{ \boldsymbol{p}_1, \dots, \boldsymbol{p}_n \}, \|(\boldsymbol{p}_i, \boldsymbol{s}_i)\| \leq \delta \end{split}$$

or range measurements; instead visiting  $s \in S$ , we can visit p within  $\delta$  distance from s.

Overview of the Lecture

Visiting all locations

■ The Traveling Salesman Problem (TSP).

with many existing approaches.

Well-studied combinatorial routing problem

characterizing the reward if data from si are collected.

■ Let each of n sensors  $S = \{s_1, \dots, s_n\}$ ,  $s_i \in \mathbb{R}^2$  be associated with a score  $\zeta_i$ 

• The vehicles start at  $s_1$ , terminates at  $s_n$ , its travel cost between  $p_i$  and  $p_i$  is

the Euclidean distance  $|(\mathbf{p}_i - \mathbf{p}_i)|$ , and it has limited travel budget  $T_{\text{max}}$ . ■ The OP stands to determine a subset of k locations  $S_k \subseteq S$  maximizing the

collected rewards while the tour cost visiting  $S_k$  does not exceed  $T_{max}$ .

shortest possible path/time or under limited travel budget.

■ The Orienteering Problem (OP)

Limited travel budget

problem with profits.

In both problems, we can improve the solution by exploiting non-zero sensing range.

■ We need to prioritize some locations - routing

### Data Collection Planning as the Traveling Salesman Problem

- Let S be a set of n sensor locations  $S = \{s_1, \dots, s_n\}, s_i \in \mathbb{R}^2$  and  $c(s_i, s_i)$  is a cost of travel from  $s_i$  to  $s_i$ .
- The problem is to determine a closed tour visiting each  $s \in S$  such that the total tour length is minimal, i.e., determine a sequence of visits  $\Sigma = (\sigma_1, \dots, \sigma_n)$ .

■ The TSP is a pure combinatorial optimization problem to find the best sequence of visits  $\Sigma$ .

Close Enough TSP for disk-shaped neighborhoods

continuous optimization with at least *n*-variables.

■ The problem becomes a combination of combinatorial and ■ The problem is a variant of the TSP with Neighborhoods or

Standard benchmarks have been established, such as

CGW (Chao, Golden, and Wasil). Chao, et al., 1996

## Data Collection with Limited Travel Budget OP with Neighborhoods (OPN) and Close Enough OP (CEOP) Data collection using wireless data transfer or remote sensing allows to reliably

- retrieve data within some sensing range  $\delta$ .
- The OP becomes the Orienteering Problem with Neighborhoods (OPN).
- For the disk-shaped  $\delta$ -neighborhood, we call it the Close Enough OP (CEOP).
- In addition to  $S_k$  and  $\Sigma$ , we need to determine the most suitable waypoint locations  $P_k$  that maximize the collected rewards and the path connecting  $P_k$ does not exceed Tmax.
  - subject to

 $p_{\sigma_1} = s_1, p_{\sigma_k} = s_n.$ 

OPN/CEOP has been firstly tackled by SOM-based approach.

 Later addressed by the GSOA and Variable Neighborhoods Search (VNS)

and optimal solution of the discrete Set OP.

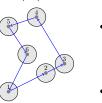

(Pēnička Faigl & Saska 2019) The currently best performing method is based on the Greedy

Randomized Adaptive Search Procedure (GRASP).

 Solve the problem as a regular TSP using centroids of the regions (disks) to get the sequence of visits  $\Sigma$ .

• Sample each neighborhood with k samples (e.g., k = 6) and find the shortest tour by forward search in  $O(nk^2)$  for  $nk^2$  edges in the sequence. • For k possible initial locations, the optimal solution can be found in

 $\mathcal{O}(nk^3)$ .

• For a set of n sets  $S = \{S_1, \dots, S_n\}$ , each

with particular set of locations (nodes)  $S_i =$  $\{s_1^i, \ldots, s_n^i\}$ , determine the shortest tour visit-

Generalized Traveling Salesman Problem (GTSP).

## Transformed ATSP (using "Big M" as ∞ representation)

Noon, C.E., Bean, J.C.: An efficient transformation of Systems and Operational Research, 31(1):39-44, 1993.

## Noon-Bean Transformation – Summary

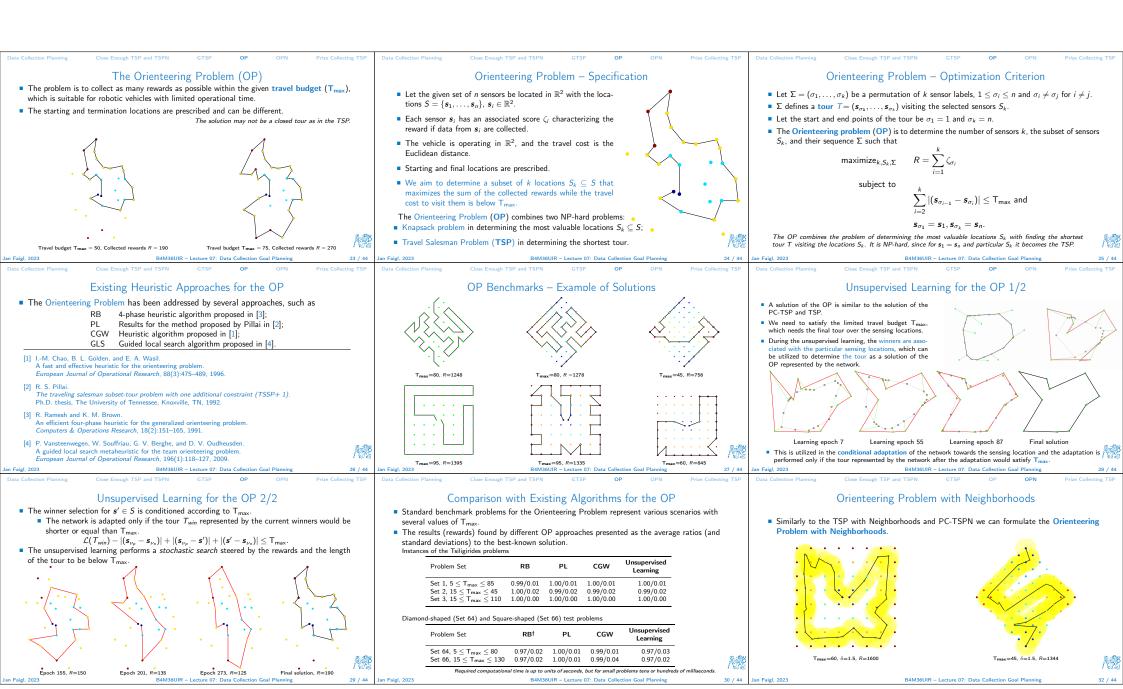

- It transforms the GATSP into the ATSP that can be further addressed as follows.
  - Solved by existing solvers, e.g., the Lin-Kernighan heuristic algorithm (LKH).
  - The ATSP can be further transformed into the TSP and solve it optimaly, e.g., by the Concorde solver.
- It runs in  $\mathcal{O}(k^2n^2)$  time and uses  $\mathcal{O}(k^2n^2)$  memory, where n is the number of sets (regions) each with up to k samples.
- The transformed ATSP problem contains kn vertices.

a set of 3D regions.

## PC-TSPN - Optimization Criterion

42(4):715-738, 2018.

Pěnička, R., Faigl, J., and Saska,

ational Research, 276(3):816-825, 2019

### The PC-TSPN is a problem to

Stefaníková, P., Váňa, P., and Faigl, J.: Greedy Ra

- Determine a set of unique locations  $P = \{p_1, ..., p_k\}$ ,  $k \le n$ ,  $p_i \in \mathbb{R}^2$ , at which data readings are performed.
- Find a cost efficient tour T visiting P such that the total cost C(T) of T is minimal

$$\mathcal{C}(T) = \sum_{(\boldsymbol{p}_{l_i}, \boldsymbol{p}_{l_{i+1}}) \in T} |(\boldsymbol{p}_{l_i} - \boldsymbol{p}_{l_{i+1}})| + \sum_{\boldsymbol{s} \in S \setminus S_T} \xi(\boldsymbol{s}),$$

where  $S_T \subseteq S$  are sensors such that for each  $\mathbf{s}_i \in S_T$  there is  $\mathbf{p}_L$  on  $T = (\boldsymbol{p}_{l_1}, \dots, \boldsymbol{p}_{l_{k-1}}, \boldsymbol{p}_{l_k})$  and  $\boldsymbol{p}_{l_i} \in P$  for which  $|(\boldsymbol{s}_i - \boldsymbol{p}_{l_i})| \leq \delta$ .

PC-TSPN includes other variants of the TSP:

national Joint Conference on Neural Networks (IJCNN), 2017, pp 2611-2620.

- for  $\delta = 0$  it is the PC-TSP;
- for  $\xi(\mathbf{s}_i) = 0$  and  $\delta \ge 0$  it is the TSPN:
- for  $\xi(s_i) = 0$  and  $\delta = 0$  it is the ordinary TSP.

## A

## Autonomous (Underwater) Data Collection

- · Having a set of sensors (sampling stations), we aim to determine a cost-efficient path to retrieve data by autonomous underwater vehicles (AUVs) from the individual sensors. E.g., Sampling stations on the ocean floor.
- The planning problem is a variant of the Traveling Salesman Problem.

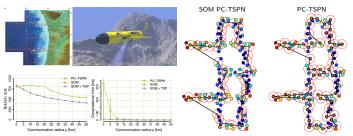

### Two practical aspects of the data collection can be identified.

- 1. Data from particular sensors may be of different impor-
- 2. Data from the sensor can be retrieved using wireless communication

These two aspects (of general applicability) can be considered in the Prize-Collecting Traveling Salesman Problem (PC-TSP) and Orienteering Problem (OP) and their extensions

## PC-TSPN - Example of Solution

Ocean Observatories Initiative (OOI) scenario

ral Networks and Learning Systems, 29(5):1703-1715, 2018.

## Prize-Collecting Traveling Salesman Problem with Neighborhoods (PC-TSPN)

- Let *n* sensors be located in  $\mathbb{R}^2$  at the locations  $S = \{s_1, \dots, s_n\}$ .
- **Each** sensor has associated penalty  $\xi(s_i) \geq 0$  characterizing additional cost if the data are not retrieved from  $s_i$ .
- Let the data collecting vehicle operates in  $\mathbb{R}^2$  with the motion cost  $c(\pmb{p}_1, \pmb{p}_2)$  for all pairs of points  $\boldsymbol{p}_1, \boldsymbol{p}_2 \in \mathbb{R}^2$ .
- The data from  $\mathbf{s}_i$  can be retrieved within  $\delta$  distance from  $\mathbf{s}_i$ .

Summary of the Lecture

Topics Discussed

## Topics Discussed

- Data collection planning formulated as variants of
  - Traveling Salesman Problem (TSP)
     Orienteering Problem (OP)

  - Prize-Collecting Traveling Salesman Problem with Neighborhoods (PC-TSPN)
- Exploiting the non-zero sensing range can be addressed as
   TSP with Neighborhoods (TSPN) or specifically as the Close Enough TSP (CETSP) for disk-shaped neighborhoods.

  OP with Neighborhoods (OPN) or the Close Enough OP (CEOP).
- Problems with continuous neighborhoods include continuous optimization that can be addressed by sampling the neighborhoods into discrete sets.

  Generalized TSP and Set OP
- Existing solutions include
  - Approximation algorithms and heuristics (combinatorial, unsupervised learning, evolutionary methods)

  - Sampling-based and decoupled approaches
     ILP formulations for discrete problem variants (sampling-based approaches)
     Transformation based approaches (GTSP—ATSP) / Noon-Bean transformation

  - Combinatorial heuristics such as VNS and GRASP
- TSP can be solved by efficient heuristics such as LKH
