Unreliable actions in observable grid world

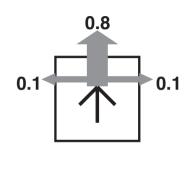

States $s \in \mathcal{S}$, actions $a \in \mathcal{A}$ (Transition) Model $T(s, a, s') \equiv p(s'|s, a) =$ probability that a in s leads to s

Unreliable actions in observable grid world

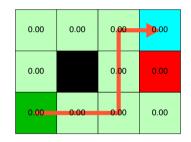

States $s \in \mathcal{S}$, actions $a \in \mathcal{A}$ (Transition) Model $T(s, a, s') \equiv p(s'|s, a) = \text{probability that } a \text{ in } s \text{ leads to } s'$

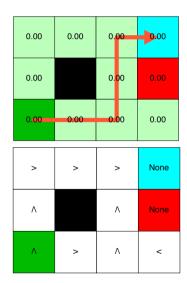

Unreliable (results of) actions

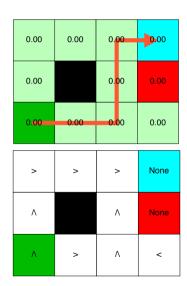

- ► In deterministic world: Plan sequence of actions from Start to Goal.
- ▶ MDPs, we need a policy $\pi: \mathcal{S} \to \mathcal{A}$
- An action for each possible state. Why each?
- What is the best policy?

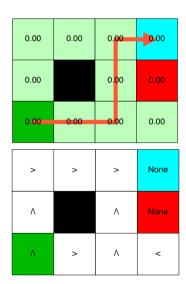

- ► In deterministic world: Plan sequence of actions from Start to Goal.
- ▶ MDPs, we need a policy $\pi: \mathcal{S} \to \mathcal{A}$.
- An action for each possible state. Why each?
- What is the best policy?

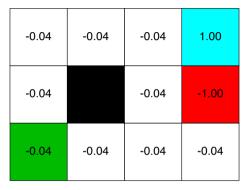

- ► In deterministic world: Plan sequence of actions from Start to Goal.
- ▶ MDPs, we need a policy $\pi: \mathcal{S} \to \mathcal{A}$.
- ▶ An action for each possible state. Why each?
- What is the best policy?

- ► In deterministic world: Plan sequence of actions from Start to Goal.
- ▶ MDPs, we need a policy $\pi: \mathcal{S} \to \mathcal{A}$.
- ▶ An action for each possible state. Why each?
- ▶ What is the *best* policy?

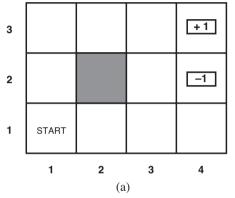

Rewards

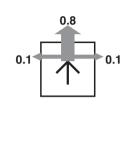

Reward : Robot/Agent takes an action a and it is **immediately** rewarded.

Reward function r(s) (or r(s, a), r(s, a, s')) $= \begin{cases} -0.04 & \text{(small penalty) for nonterminal states} \\ \pm 1 & \text{for terminal states} \end{cases}$

Markov Decision Processes (MDPs)

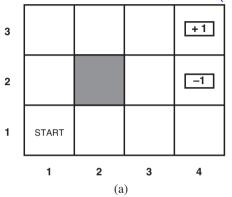

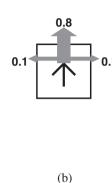

(b)

States $s \in S$, actions $a \in A$ Model $T(s, a, s') \equiv p(s'|s, a) = \text{probability that } a \text{ in } s$ Reward function r(s) (or r(s, a), r(s, a, s'))

 $= \left\{ egin{array}{ll} -0.04 & ext{(small penalty) for nonterminal states} \ \pm 1 & ext{for terminal states} \end{array}
ight.$

Markov Decision Processes (MDPs)

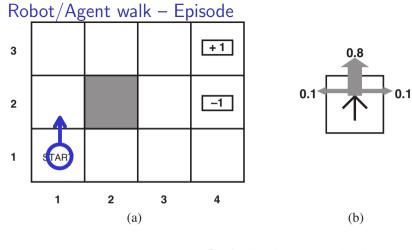

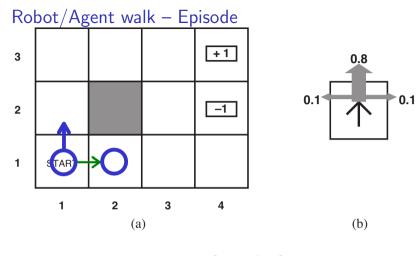

States
$$s \in \mathcal{S}$$
, actions $a \in \mathcal{A}$
Model $T(s, a, s') \equiv p(s'|s, a) = \text{probability that } a \text{ in } s \text{ leads to } s'$
Reward function $r(s)$ (or $r(s, a)$, $r(s, a, s')$)
$$= \begin{cases} -0.04 & \text{(small penalty) for nonterminal states} \\ \pm 1 & \text{for terminal states} \end{cases}$$

 $S_0, A_0, R_1, S_1, A_1, R_2, S_2, A_2 \dots$

 $S_0, A_0, R_1, S_1, A_1, R_2, S_2, A_2 \dots$

 $S_0, A_0, R_1, S_1, A_1, R_2, S_2, A_2 \dots$

 $S_0, A_0, R_1, S_1, A_1, R_2, S_2, A_2 \dots$

 $S_0, A_0, R_1, S_1, A_1, R_2, S_2, A_2 \dots$

Markovian property

- ▶ Given the present state, the future and the past are independent.
- ▶ MDP: Markov means action depends only on the current state.
- In search: successor function (transition model) depends on the current state only.

Desired robot/agent behavior specified through rewards

- Before: shortest/cheapest path
- Solution found by search.
- Environment/problem is defined through the reward function
- Optimal policy is to be computed/learned.

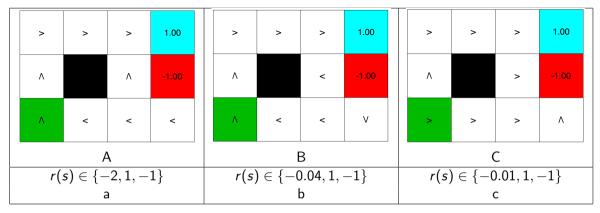

Desired robot/agent behavior specified through rewards

- ► Before: shortest/cheapest path
- Solution found by search.
- ► Environment/problem is defined through the reward function.
- ▶ Optimal policy is to be computed/learned.

Desired robot/agent behavior specified through rewards

- ► Before: shortest/cheapest path
- Solution found by search.
- ► Environment/problem is defined through the reward function.
- ▶ Optimal policy is to be computed/learned.

We come back to this in more detail when discussing RL.

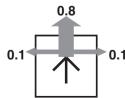

A: A-a, B-b, C-c

B: A-b, B-a, C-c

C: A-b, B-c, C-a

D: A-c, B-a, C-b

- \triangleright State reward at time/step t, R_t .
- ▶ State at time t, S_t . State sequence $[S_0, S_1, S_2, ...,]$

Typically, consider stationary preferences on reward sequences

$$[R, R_1, R_2, R_3, \ldots] \succ [R, R'_1, R'_2, R'_3, \ldots] \Leftrightarrow [R_1, R_2, R_3, \ldots] \succ [R'_1, R'_2, R'_3, \ldots]$$

If stationary preferences : Utility (h-history) $U_h([S_0,S_1,S_2,\ldots,])=R_1+R_2+R_3+\cdots$

- ▶ State reward at time/step t, R_t .
- ▶ State at time t, S_t . State sequence $[S_0, S_1, S_2, ...,]$

Typically, consider stationary preferences on reward sequences:

$$[R, R_1, R_2, R_3, \ldots] \succ [R, R'_1, R'_2, R'_3, \ldots] \Leftrightarrow [R_1, R_2, R_3, \ldots] \succ [R'_1, R'_2, R'_3, \ldots]$$

Utility (h-history) $U_h([S_0,S_1,S_2,\ldots,])=R_1+R_2+R_3+\cdots$

- \triangleright State reward at time/step t, R_t .
- ▶ State at time t, S_t . State sequence $[S_0, S_1, S_2, ...,]$

Typically, consider stationary preferences on reward sequences:

$$[R,R_1,R_2,R_3,\ldots] \succ [R,R_1',R_2',R_3',\ldots] \Leftrightarrow [R_1,R_2,R_3,\ldots] \succ [R_1',R_2',R_3',\ldots]$$

If stationary preferences : Utility (h-history) $U_h([S_0, S_1, S_2, \dots,]) = R_1 + R_2 + R_3 + \cdots$

- \triangleright State reward at time/step t, R_t .
- ▶ State at time t, S_t . State sequence $[S_0, S_1, S_2, ...,]$

Typically, consider stationary preferences on reward sequences:

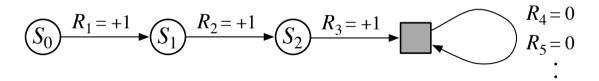

$$[R,R_1,R_2,R_3,\ldots] \succ [R,R_1',R_2',R_3',\ldots] \Leftrightarrow [R_1,R_2,R_3,\ldots] \succ [R_1',R_2',R_3',\ldots]$$

If stationary preferences : Utility (h-history) $U_h([S_0, S_1, S_2, \dots,]) = R_1 + R_2 + R_3 + \cdots$

Finite walk – Episode – and its Return (by introducing Terminal state)

- Executing policy sequence of states and rewards.
- **Episode** starts at t, ends at T (ending in a terminal state).
- Return (Utility) of the episode (policy execution)

$$G_t = R_{t+1} + R_{t+2} + R_{t+3} + \cdots + R_T$$

Horizon too far, infinite - Discount rewards

Problem: Infinite lifetime ⇒ additive utilities are infinite.

- ▶ Finite horizon: termination at a fixed time \Rightarrow nonstationary policy, $\pi(s)$ depends on the time left.
- Absorbing (terminal) state. (sooner or later walk ends here)
- ightharpoonup Discounted return , $\gamma < 1, R_t \le R_{\text{max}}$

$$G_t = R_{t+1} + \gamma R_{t+2} + \gamma^2 R_{t+3} + \dots = \sum_{k=0}^{\infty} \gamma^k R_{t+k+1} \le \frac{R_{\mathsf{max}}}{1 - \gamma}$$

$$G_{t} = R_{t+1} + \gamma R_{t+2} + \gamma^{2} R_{t+3} + \gamma^{3} R_{t+4} + \cdots$$

$$= R_{t+1} + \gamma (R_{t+2} + \gamma^{1} R_{t+3} + \gamma^{2} R_{t+4} + \cdots)$$

$$= R_{t+1} + \gamma G_{t+1}$$

Horizon too far, infinite – Discount rewards

Problem: Infinite lifetime ⇒ additive utilities are infinite.

MDPs recap

Markov decision processes (MDPs):

- \triangleright Set of states \mathcal{S}
- \triangleright Set of actions \mathcal{A}
- ▶ Transitions p(s'|s, a) or T(s, a, s')
- ▶ Reward function r(s, a, s'); and discount γ
- Alternative to last two: p(s', r|s, a).

MDP quantities:

- lacktriangle (deterministic) Policy $\pi(s)$ choice of action for each state
- Return (Utility) of an episode (sequence) sum of (discounted) rewards.

MDPs recap

Markov decision processes (MDPs):

- \triangleright Set of states \mathcal{S}
- \triangleright Set of actions \mathcal{A}
- ► Transitions p(s'|s, a) or T(s, a, s')
- ▶ Reward function r(s, a, s'); and discount γ
- Alternative to last two: p(s', r|s, a).

MDP quantities:

- (deterministic) Policy $\pi(s)$ choice of action for each state
- ▶ Return (Utility) of an episode (sequence) sum of (discounted) rewards.

Expected Return of a policy π

- ightharpoonup Executing policy $\pi \to \text{sequence of states (and rewards)}.$
- Utility of a state sequence.
- But actions are unreliable environment is stochastic
- ightharpoonup Expected return of a policy π .

Starting at time t, i.e. S_t ,

$$U^{\pi}(S_t) \doteq \mathbb{E}^{\pi} \left[\sum_{k=0}^{\infty} \gamma^k R_{t+k+1} \right]$$

Expected Return of a policy π

- ightharpoonup Executing policy $\pi \to \text{sequence of states (and rewards)}.$
- Utility of a state sequence.
- But actions are unreliable environment is stochastic.
- ightharpoonup Expected return of a policy π .

Starting at time t, i.e. S_t ,

$$U^{\pi}(S_t) \doteq \mathbb{E}^{\pi} \left[\sum_{k=0}^{\infty} \gamma^k R_{t+k+1} \right]$$

Expected Return of a policy π

- ightharpoonup Executing policy $\pi \to \text{sequence of states (and rewards)}.$
- Utility of a state sequence.
- But actions are unreliable environment is stochastic.
- **Expected return** of a policy π .

Starting at time t, i.e. S_t ,

$$U^{\pi}(S_t) \doteq \mathsf{E}^{\pi} \left[\sum_{k=0}^{\infty} \gamma^k R_{t+k+1} \right]$$

(State) Value functions given policy π

Expected return from that state (state, action)

Value function

$$u^\pi(s) \doteq \mathsf{E}^\pi \left[\mathsf{G}_t \mid \mathsf{S}_t = s
ight] = \mathsf{E}^\pi \left[\sum_{k=0}^\infty \gamma^k \mathsf{R}_{t+k+1} \; \middle| \; \mathsf{S}_t = s
ight]$$

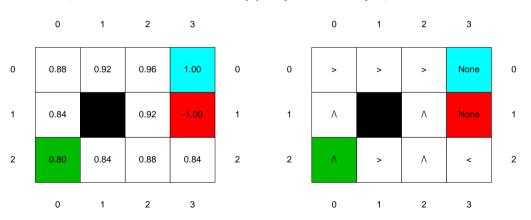

Action-value function (q-function)

$$q^\pi(s,a) \doteq \mathsf{E}^\pi \left[\mathsf{G}_t \mid \mathsf{S}_t = s, \mathsf{A}_t = a
ight] = \mathsf{E}^\pi \left[\sum_{k=0}^\infty \gamma^k \mathsf{R}_{t+k+1} \; \middle| \; \mathsf{S}_t = s, \mathsf{A}_t = a
ight]$$

 $v^*(s) = \text{expected (discounted)}$ sum of rewards (until termination) assuming optimal actions.

 $v^*(s) = \text{expected (discounted)}$ sum of rewards (until termination) assuming optimal actions.

Example 1, Robot *deterministic*: $r(s) = \{-0.04, 1, -1\}, \ \gamma = 0.9999999, \ \epsilon = 0.03$

 $v^*(s) = \text{expected (discounted)}$ sum of rewards (until termination) assuming optimal actions.

Example 2, Robot *non-deterministic*: $r(s) = \{-0.04, 1, -1\}, \gamma = 0.9999999, \epsilon = 0.03$

 $v^*(s) = \text{expected (discounted)}$ sum of rewards (until termination) assuming optimal actions.

Example 3, Robot *non-deterministic*: $r(s) = \{-0.01, 1, -1\}, \gamma = 0.9999999, \epsilon = 0.03$

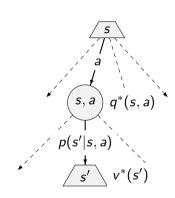

MDP search tree

MDP search tree

The value of a q-state (s, a):

$$q^*(s, a) = \sum_{s'} p(s'|a, s) [r(s, a, s') + \gamma v^*(s'))]$$

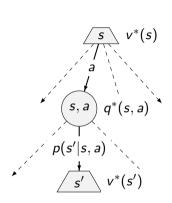

MDP search tree

The value of a q-state (s, a):

$$q^*(s, a) = \sum_{s'} p(s'|a, s) \left[r(s, a, s') + \gamma v^*(s') \right]$$

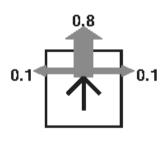

The value of a state s:

$$v^*(s) = \max_a q^*(s, a)$$

Bellman (optimality) equation

$$v^{*}(s) = \max_{a \in A(s)} \sum_{s'} p(s'|a, s) \left[r(s, a, s') + \gamma v^{*}(s') \right]$$
0
1
2
START
0.1

$$v^*(s) = \max_{a \in A(s)} \sum_{s'} p(s'|a,s) \left[r(s,a,s') + \gamma v^*(s') \right]$$

- Start with arbitrary $V_0(s)$ (except for terminals)
- Compute Bellman update (one ply of expectimax from each state)

$$V_{k+1}(s) \leftarrow R(s) + \gamma \max_{a \in A(s)} \sum_{s'} p(s'|s, a) V_k(s')$$

Repeat until convergence

The idea: Bellman update makes local consistency with the Bellmann equation. Everywhere locally consistent \Rightarrow globally optimal.

$$v^*(s) = \max_{a \in A(s)} \sum_{s'} p(s'|a, s) [r(s, a, s') + \gamma v^*(s')]$$

- Start with arbitrary $V_0(s)$ (except for terminals)
- Compute Bellman update (one ply of expectimax from each state)

$$V_{k+1}(s) \leftarrow R(s) + \gamma \max_{a \in A(s)} \sum_{s'} p(s'|s, a) V_k(s')$$

Repeat until convergence

The idea: Bellman update makes local consistency with the Bellmann equation. Everywhere locally consistent \Rightarrow globally optimal.

$$v^*(s) = \max_{a \in A(s)} \sum_{s'} p(s'|a,s) \left[r(s,a,s') + \gamma v^*(s') \right]$$

- Start with arbitrary $V_0(s)$ (except for terminals)
- ► Compute Bellman update (one ply of expectimax from each state)

$$V_{k+1}(s) \leftarrow R(s) + \gamma \max_{a \in A(s)} \sum_{s'} p(s'|s, a) V_k(s')$$

Repeat until convergence

The idea: Bellman update makes local consistency with the Bellmann equation. Everywhere locally consistent \Rightarrow globally optimal.

$$v^*(s) = \max_{a \in A(s)} \sum_{s'} p(s'|a, s) [r(s, a, s') + \gamma v^*(s')]$$

- ▶ Start with arbitrary $V_0(s)$ (except for terminals)
- Compute Bellman update (one ply of expectimax from each state)

$$V_{k+1}(s) \leftarrow R(s) + \gamma \max_{a \in A(s)} \sum_{s'} p(s'|s, a) V_k(s')$$

Repeat until convergence

The idea: Bellman update makes local consistency with the Bellmann equation. Everywhere locally consistent \Rightarrow globally optimal.

Value iteration - Complexity of one estimation sweep

$$V_{k+1}(s) \leftarrow R(s) + \gamma \max_{a \in A(s)} \sum_{s'} p(s'|s, a) V_k(s')$$

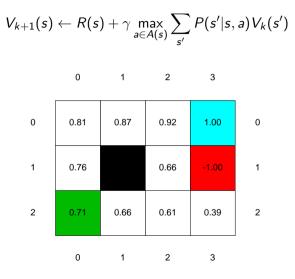

A: O(AS)

B: $O(S^2)$

 $C: O(AS^2)$

D: $O(A^2S^2)$

Value iteration demo

Convergence

$$egin{aligned} V_{k+1}(s) \leftarrow R(s) + \gamma \max_{a \in A(s)} \sum_{s'} P(s'|s,a) V_k(s') \ & \gamma < 1 \ & -R_{\mathsf{max}} \leq R(s) \leq R_{\mathsf{max}} \end{aligned}$$

Max norm

$$\|v\|_{\infty} = \max_{s} |v(s)|$$
 $U([s_0, s_1, s_2, \dots, s_{\infty}]) = \sum_{t=0}^{\infty} \gamma^t R(s_t) \leq \frac{R_{\max}}{1 - \gamma}$

Convergence

$$V_{k+1}(s) \leftarrow R(s) + \gamma \max_{a \in A(s)} \sum_{s'} P(s'|s, a) V_k(s')$$

$$\gamma < 1$$

$$-R_{\mathsf{max}} \leq R(s) \leq R_{\mathsf{max}}$$

Max norm:

$$\|V\|_{\infty} = \max_{s} |V(s)|$$
 $U([s_0, s_1, s_2, \dots, s_{\infty}]) = \sum_{t=0}^{\infty} \gamma^t R(s_t) \leq \frac{R_{\mathsf{max}}}{1-\gamma}$

Convergence cont'd

$$V_{k+1} \leftarrow BV_k \dots B$$
 as the Bellman update $V_{k+1}(s) \leftarrow R(s) + \gamma \max_{a \in A(s)} \sum_{s'} p(s'|s,a) V_k(s')$

$$||BV_k - BV_k'||_{\infty} \le \gamma ||V_k - V_k'||_{\infty}$$
$$||BV_k - V_{\text{true}}||_{\infty} < \gamma ||V_k - V_{\text{true}}||_{\infty}$$

Rewards are bounded, at the beginning then Value error is

$$\|V_0 - V_{true}\|_{\infty} \leq \frac{2R_{\mathsf{max}}}{1-\gamma}$$

We run N iterations and reduce the error by factor γ in each and want to stop the error is below ϵ :

$$\gamma^N 2R_{\max}/(1-\gamma) \le \epsilon$$
 Taking logs, we find: $N \ge \frac{\log(2R_{\max}/\epsilon(1-\gamma))}{\log(1/\gamma)}$

To stop the iteration we want to find a bound relating the error to the size of *one* Bellman update for any given iteration.

If we stop when

$$\|V_{k+1}-V_k\|_{\infty} \leq \frac{\epsilon(1-\gamma)}{\gamma}$$

then also: $\|V_{k+1} - V_{\mathsf{true}}\|_{\infty} \leq \epsilon$ Proof on the next slide

Convergence cont'd

$$\|V_{k+1} - V_{\text{true}}\|_{\infty} \le \epsilon$$
 is the same as $\|V_{k+1} - V_{\infty}\|_{\infty} \le \epsilon$
Assume $\|V_{k+1} - V_k\|_{\infty} = \text{err}$

In each of the following iteration steps we reduce the error by the factor γ (because $\|BV_k - V_{\text{true}}\|_{\infty} \le \gamma \|V_k - V_{\text{true}}\|_{\infty}$). Till ∞ , the total sum of reduced errors is:

total =
$$\gamma$$
err + γ^2 err + γ^3 err + γ^4 err + \cdots = $\frac{\gamma$ err γ^4 err + γ^4 err +

We want to have total $< \epsilon$.

$$rac{\gamma \mathsf{err}}{(1-\gamma)} < \epsilon$$

From it follows that

$$\operatorname{\mathsf{err}} < rac{\epsilon(1-\gamma)}{\gamma}$$

Hence we can stop if $\|V_{k+1} - V_k\|_{\infty} < \epsilon(1-\gamma)/\gamma$

function VALUE-ITERATION(env,\epsilon) returns: state values V
   input: env - MDP problem, \epsilon
    V' \leftarrow 0 in all states
                                                                repeat
        V \leftarrow V'
                                                        \delta \leftarrow 0
                                                                        > reset the max difference
        for each state s in S do
           V'[s] \leftarrow R(s) + \gamma \max_{a \in A(s)} \sum_{s'} P(s'|s, a) V(s')
           if |V'[s] - V[s]| > \delta then \delta \leftarrow |V'[s] - V[s]|
   until \delta < \epsilon (1 - \gamma)/\gamma
```

Sync vs. async Value iteration

```
function VALUE-ITERATION(env,\epsilon) returns: state values V
   input: env - MDP problem, \epsilon
    V' \leftarrow 0 in all states
                                                                repeat
        V = V'
                                                              \delta \leftarrow 0
                                                                        > reset the max difference
        for each state s in S do
           V'[s] \leftarrow R(s) + \gamma \max_{a \in A(s)} \sum_{s'} P(s'|s, a) V(s')
           if |V'[s] - V[s]| > \delta then \delta \leftarrow |V'[s] - V[s]|
   until \delta < \epsilon (1 - \gamma)/\gamma
```

What we have learned

- Uncertain outcome of an action
- Optimal policy (strategy, sequence of decisions) maximizes expected return (utility, sum of rewards)
- ► (State) Value function given policy
- ▶ Value iteration method through local (optimal) updated to global optimality

References

Some figures from [1] (chapter 17) but notation slightly changed in order to adapt notation from [2] (chapters 3, 4) which will help us in the Reinforcement Learning part of the course. Note that the book [2] is available on-line.
