

**Epistasis.
Estimation-of-Distribution Algorithms.**

Petr Pošík

Introduction to Epistasis

GA works well...

Problem f_1 :

- defined over 40-bit strings
- the quality of the worst solution: $f_1(x^{\text{worst}}) = 0$.
- the quality of the best solution: $f_1(x^{\text{opt}}) = 40$.
- the best solution: $x^{\text{opt}} = (1111 \dots 1)$.

GA: pop. size 160, uniform crossover, bit-flip mutation

Epistasis

Scalability Analysis

Summary

GA works again...

Still solving f_2 :

- defined over 40-bit strings
- the quality of the worst solution: $f_2(x^{\text{worst}}) = 0$.
- the quality of the best solution: $f_2(x^{\text{opt}}) = 40$.
- the best solution: $x^{\text{opt}} = (1111 \dots 1)$.

Instead of the uniform crossover,

- let us *allow the crossover only after each 5th bit*.

Summary

Epistasis

Epistasis:

- Effects of one gene are dependent on (influenced, conditioned by) other genes.
- Other names: dependencies, interdependencies, interactions.

Linkage:

- Tendency of certain loci or alleles to be inherited together.

When optimizing the following functions, which of the variables are linked together?

$$f = x_1 + x_2 + x_3 \quad (1)$$

$$f = 0.1x_1 + 0.7x_2 + 3x_3 \quad (2)$$

$$f = x_1x_2x_3 \quad (3)$$

$$f = x_1 + x_2^2 + \sqrt{x_3} \quad (4)$$

$$f = \sin(x_1) + \cos(x_2) + e^{x_3} \quad (5)$$

$$f = \sin(x_1 + x_2) + e^{x_3} \quad (6)$$

Epistasis

Scalability Analysis

Summary

Epistasis

Epistasis:

- Effects of one gene are dependent on (influenced, conditioned by) other genes.
- Other names: dependencies, interdependencies, interactions.

Linkage:

- Tendency of certain loci or alleles to be inherited together.

When optimizing the following functions, which of the variables are linked together?

$$f = x_1 + x_2 + x_3 \quad (1)$$

$$f = 0.1x_1 + 0.7x_2 + 3x_3 \quad (2)$$

$$f = x_1x_2x_3 \quad (3)$$

$$f = x_1 + x_2^2 + \sqrt{x_3} \quad (4)$$

$$f = \sin(x_1) + \cos(x_2) + e^{x_3} \quad (5)$$

$$f = \sin(x_1 + x_2) + e^{x_3} \quad (6)$$

Notes:

- Almost all real-world problems contain interactions among design variables.
- The “amount” and “type” of interactions depend on the representation and the objective function.
- Sometimes, by a clever choice of the representation and the objective function, we can get rid of the interactions.

Epistasis

Scalability Analysis

Summary

Linkage Identification Techniques

Problems:

- How to detect dependencies among variables?
- How to use them?

Techniques used for linkage identification:

1. Indirect detection along genetic search (messy GAs)
2. Direct detection of fitness changes by perturbation
3. Model-based approach: classification
4. Model-based approach: distribution estimation (EDAs)

Epistasis

Pairwise Interactions

Multivar. Interactions

Scalability Analysis

Summary

Introduction to EDAs

Genetic Algorithms

Algorithm 1: Genetic Algorithm

```
1 begin
2   Initialize the population.
3   while termination criteria are not met do
4     Select parents from the population.
5     Cross over the parents, create offspring.
6     Mutate offspring.
7     Incorporate offspring into the population.
```

“Select → cross over → mutate” approach

Conventional GA operators

- are not adaptive, and
- cannot (or usually do not) discover and use *the interactions among solution components*.

Multivar. Interactions

Scalability Analysis

Summary

Algorithm 1: Genetic Algorithm

```
1 begin
2   Initialize the population.
3   while termination criteria are not met do
4     Select parents from the population.
5     Cross over the parents, create offspring.
6     Mutate offspring.
7     Incorporate offspring into the population.
```

“Select → cross over → mutate” approach

Conventional GA operators

- are not adaptive, and
- cannot (or usually do not) discover and use *the interactions among solution components*.

The goal of recombination operators:

- Intensify the search in areas which contained “good” individuals in previous iterations.
- Must be able to take the interactions into account.
- Why not directly describe the distribution of “good” individuals???

GA vs EDA

Algorithm 1: Genetic Algorithm

```
1 begin
2   Initialize the population.
3   while termination criteria are not met do
4     Select parents from the population.
5     Cross over the parents, create offspring.
6     Mutate offspring.
7     Incorporate offspring into the population.
```

“Select → cross over → mutate” approach

Why not use directly...

Algorithm 2: Estimation-of-Distribution Alg.

```
1 begin
2   Initialize the population.
3   while termination criteria are not met do
4     Select parents from the population.
5     Learn a model of their distribution.
6     Sample new individuals.
7     Incorporate offspring into the
      population.
```

“Select → update model → sample” approach

GA vs EDA

Algorithm 1: Genetic Algorithm

```
1 begin
2   Initialize the population.
3   while termination criteria are not met do
4     Select parents from the population.
5     Cross over the parents, create offspring.
6     Mutate offspring.
7     Incorporate offspring into the population.
```

“Select → cross over → mutate” approach

Why not use directly...

Algorithm 2: Estimation-of-Distribution Alg.

```
1 begin
2   Initialize the population.
3   while termination criteria are not met do
4     Select parents from the population.
5     Learn a model of their distribution.
6     Sample new individuals.
7     Incorporate offspring into the
      population.
```

“Select → update model → sample” approach

Or even...

Algorithm 3: Estimation-of-Distribution Alg. (Type 2)

```
1 begin
2   Initialize the model.
3   while termination criteria are not met do
4     Sample new individuals.
5     Select better ones.
6     Update the model based on selected
      ones.
```

“Sample → select → update model” approach

EDAs

Explicit probabilistic model:

- Sound and principled way of working with dependencies.
- Adaptation ability (different behavior in different stages of evolution).

Names:

EDA Estimation-of-Distribution Algorithm

PMBGA Probabilistic Model-Building Genetic Algorithm

IDEA Iterated Density Estimation Algorithm

Continuous EDAs (a very simplified view):

- Histograms and (Mixtures of) Gaussian distributions are used most often as the probabilistic model.
- Algorithms with Gaussians usually become very similar to CMA-ES.

In the following, we shall talk only about discrete (binary) EDAs.

Scalability Analysis

Summary

How do EDAs work?

Example

5-bit OneMax (CountOnes) problem:

- $f_{D \times 1 \text{bitOneMax}}(\mathbf{x}) = \sum_{d=1}^D x_d$
- Optimum: 11111, fitness: 5

Algorithm: **Univariate Marginal Distribution Algorithm (UMDA)**

- Population size: 6
- Tournament selection: $t = 2$
- **Model:** vector of probabilities $p = (p_1, \dots, p_D)$
 - each p_d is the probability of observing 1 at d th element
- **Model learning:**
 - estimate p from selected individuals
- **Model sampling:**
 - generate 1 on d th position with probability p_d (independently of other positions)

- Trap function
- UMDA: Traps
- Beating traps
- Good news!

[Discrete EDAs](#)

[Pairwise Interactions](#)

[Multivar. Interactions](#)

[Scalability Analysis](#)

[Summary](#)

- 1s are better than 0s on average, selection increases the proportion of 1s.
- Recombination preserves and combines 1s, the ratio of 1s increases over time.
- If we have many 1s in population, we cannot miss the optimum.

The number of evaluations needed for reliable convergence:

Algorithm	Nr. of evaluations
UMDA	$\mathcal{O}(D \ln D)$
Hill-Climber	$\mathcal{O}(D \ln D)$
GA with uniform crossover	approx. $\mathcal{O}(D \ln D)$
GA with 1-point crossover	a bit slower

UMDA behaves similarly to GA with uniform crossover!

What about a different fitness?

For OneMax function:

- UMDA works well, all the bits probably eventually converge to the right value.

Will UMDA be similarly successful for other fitness functions?

- Well,no. :-)

Problem: Concatanated 5-bit traps

$$f = f_{\text{trap}}(x_1, x_2, x_3, x_4, x_5) + \\ + f_{\text{trap}}(x_6, x_7, x_8, x_9, x_{10}) + \\ + \dots$$

The *trap* function is defined as

$$f_{\text{trap}}(\mathbf{x}) = \begin{cases} 5 & \text{if } u(\mathbf{x}) = 5 \\ 4 - u(\mathbf{x}) & \text{otherwise} \end{cases}$$

where $u(\mathbf{x})$ is the so called *unity* function and returns the number of 1s in \mathbf{x} (it is actually the One Max function).

Discrete EDAs

Pairwise Interactions

Multivar. Interactions

Scalability Analysis

Summary

UMDA behaviour on concatenated traps

Traps:

- Optimum in 111111...1.
- But $f_{\text{trap}}(0****) = 2$ while $f_{\text{trap}}(1****) = 1.375$.
- 1-dimensional probabilities lead the GA to the wrong way!
- Exponentially increasing population size is needed, otherwise GA will not find optimum reliably.

Epistasis

EDAs

How do EDAs work?

- Example
- UMDA Pipeline
- UMDA: OneMax
- Trap function
- **UMDA: Traps**
- Beating traps
- Good news!

Discrete EDAs

Pairwise Interactions

Multivar. Interactions

Scalability Analysis

Summary

What can be done about traps?

The f_{trap} function is *deceptive*:

- Statistics over 1**** and 0**** do not lead us to the right solution.
- The same holds for statistics over 11*** and 00***, 111** and 000**, 1111* and 0000*.

Epistasis

 - f_{trap} -haystack actively lies to you—it points you to the wrong part of the haystack.
- But: $f_{\text{trap}}(00000) < f_{\text{trap}}(11111)$, 11111 will be better than 00000 on average.
- 5bit statistics should work for 5bit traps in the same way as 1bit statistics work for OneMax problem!

Model learning:

- build model for each 5-tuple of bits
- compute $p(00000), p(00001), \dots, p(11111)$,

Model sampling:

- Each 5-tuple of bits is generated independently
- Generate 00000 with probability $p(00000)$, 00001 with probability $p(00001), \dots$

Epistasis

EDAs

How do EDAs work?

- Example
- UMDA Pipeline
- UMDA: OneMax
- Trap function
- UMDA: Traps
- **Beating traps**
- Good news!

Discrete EDAs

Pairwise Interactions

Multivar. Interactions

Scalability Analysis

Summary

Good news!

The right statistics work great!

Algorithm	Nr. of evaluations
UMDA with 5bit BB	$\mathcal{O}(D \ln D)$ (WOW!)
Hill-Climber	$\mathcal{O}(D^k \ln D)$, $k = 5$
GA with uniform xover	approx. $\mathcal{O}(2^D)$
GA with 1-point xover	similar to unif. xover

What shall we do next?

If we were able to

- find the right statistics with a small overhead, and
- use them in the UMDA framework,

we would be able to solve order- k separable problems using $\mathcal{O}(D^2)$ evaluations.

- ...and there are many problems of this type.

The problem solution is closely related to the so-called *linkage learning*, i.e. discovering and using statistical dependencies among variables.

Discrete EDAs

EDAs without interactions

1. **Population-based incremental learning (PBIL)** [Bal94]
2. **Univariate marginal distribution algorithm (UMDA)** [MP96]
3. **Compact genetic algorithm (cGA)** [HLG97]

Epistasis

EDAs

How do EDAs work?

Discrete EDAs

- EDAs without interactions

Pairwise Interactions

Multivar. Interactions

Scalability Analysis

Summary

Similarities:

- all of them use a vector of probabilities

Differences:

- PBIL and cGA do not use population (only the vector p); UMDA does
- PBIL and cGA use different rules for the adaptation of p

Advantages:

- Simplicity
- Speed
- Simple simulation of large populations

Limitations:

- Reliable only for order-1 decomposable problems (i.e., problems without interactions).

EDAs with Pairwise Interactions

From single bits to pairwise models

How to describe two positions together?

- Using the joint probability distribution:

Number of free parameters: 3

		$p(A, B)$	
		0	1
A	0	$p(0, 0)$	$p(0, 1)$
	1	$p(1, 0)$	$p(1, 1)$

- Using conditional probabilities:

Number of free parameters: 3

$$p(A, B) = p(B|A) \cdot p(A):$$

$$p(B = 1|A = 0)$$

$$p(B = 1|A = 1)$$

$$p(A = 1)$$

Scalability Analysis

Summary

- Nodes: binary variables (loci of chromosome)
- Edges: the strength of dependencies among variables
- Features:
 - Each node depends on at most 1 other node
 - Graph does not contain cycles
 - Graph is connected

Learning the structure of dependency tree:

1. Score the edges using mutual information:

$$I(X, Y) = \sum_{x,y} p(x, y) \cdot \log \frac{p(x, y)}{p(x)p(y)}$$

2. Use any algorithm to determine the maximum spanning tree of the graph, e.g. Prim's algorithm.
 - (a) Start building the tree from any node
 - (b) Add such a node that is connected to the tree by the edge with maximum score

Example of dependency tree learning (Max. spanning tree, Prim)

Scalability Analysis

Summary

ECGA

Extended Compact GA [Har99]

Marginal Product Model (MPM):

- Variables are treated in groups.
- Variables in different groups are considered statistically independent.
- Each group is modeled by its joint probability distribution.
- The algorithm adaptively searches for the groups during evolution.

Problem	Ideal group configuration									
OneMax	[1]	[2]	[3]	[4]	[5]	[6]	[7]	[8]	[9]	[10]
5bitTraps	[1	2	3	4	5]	[6	7	8	9	10]

Learning the structure

1. Evaluation metric: Minimum Description Length (MDL)
2. Search procedure: greedy
 - (a) Start with each variable belonging to its own group.
 - (b) Perform such a join of two groups which improves the score (MDL) best.
 - (c) Finish if no join improves the score.

Scalability Analysis

Summary

ECGA: Evaluation metric

Minimum description length:

Minimize the number of bits required to store the model and the data encoded using the model

$$DL(Model, Data) = DL_{Model} + DL_{Data}$$

Model description length:

Each group g has $|g|$ dimensions, i.e. $2^{|g|} - 1$ frequencies, each of them can take on values up to N

$$DL_{Model} = \log N \sum_{g \in G} (2^{|g|} - 1)$$

Data description length using the model:

Defined using the entropy of marginal distributions (X_g is $|g|$ -dimensional random vector, x_g is its realization):

$$DL_{Data} = N \sum_{g \in G} h(X_g) = -N \sum_{g \in G} \sum_{x_g} p(X_g = x_g) \log p(X_g = x_g)$$

Scalability Analysis

Summary

BOA: Learning the structure

1. Evaluation metric:
 - Bayesian-Dirichlet metric, or
 - Bayesian information criterion (BIC)
2. Search procedure: greedy
 - (a) Start with graph with no edges (univariate marginal product model)
 - (b) Perform one of the following operations, choose the one which improves the score best
 - Add an edge
 - Delete an edge
 - Reverse an edge
 - (c) Finish if no operation improves the score

BOA solves order- k decomposable problems in less than $\mathcal{O}(D^2)$ evaluations!

$$n_{evals} = \mathcal{O}(D^{1.55}) \text{ to } \mathcal{O}(D^2)$$

Scalability Analysis

Summary

Scalability Analysis

Test functions

One Max:

$$f_{D \times 1 \text{bitOneMax}}(\mathbf{x}) = \sum_{d=1}^D x_d$$

Trap:

$$f_{D \text{bitTrap}}(\mathbf{x}) = \begin{cases} D & \text{if } u(\mathbf{x}) = D \\ D - 1 - u(\mathbf{x}) & \text{otherwise} \end{cases}$$

Equal Pairs:

$$f_{D \text{bitEqualPairs}}(\mathbf{x}) = 1 + \sum_{d=2}^D f_{\text{EqualPair}}(x_{d-1}, x_d)$$

$$f_{\text{EqualPair}}(x_1, x_2) = \begin{cases} 1 & \text{if } x_1 = x_2 \\ 0 & \text{if } x_1 \neq x_2 \end{cases}$$

Sliding XOR:

$$f_{D \text{bitSlidingXOR}}(\mathbf{x}) = 1 + f_{\text{AllEqual}}(\mathbf{x}) + \sum_{d=3}^D f_{\text{XOR}}(x_{d-2}, x_{d-1}, x_d)$$

$$f_{\text{AllEqual}}(\mathbf{x}) = \begin{cases} 1 & \text{if } \mathbf{x} = (000 \dots 0) \\ 1 & \text{if } \mathbf{x} = (111 \dots 1) \\ 0 & \text{otherwise} \end{cases}$$

$$f_{\text{XOR}}(x_1, x_2, x_3) = \begin{cases} 1 & \text{if } x_1 \oplus x_2 = x_3 \\ 0 & \text{otherwise} \end{cases}$$

Concatenated short basis functions:

$$f_{N \times K \text{bitBasisFunction}} = \sum_{n=1}^N f_{K \text{bitBasisFunction}}(x_{K(n-1)+1}, \dots, x_{Kn})$$

Test function (cont.)

1. $f_{40 \times 1 \text{bitOneMax}}$
 - order-1 decomposable function, no interactions
2. $f_{1 \times 40 \text{bitEqualPairs}}$
 - non-decomposable function
 - weak interactions: optimal setting of each bit depends on the value of the preceding bit
3. $f_{8 \times 5 \text{bitEqualPairs}}$
 - order-5 decomposable function
4. $f_{1 \times 40 \text{bitSlidingXOR}}$
 - non-decomposable function
 - stronger interactions: optimal setting of each bit depends on the value of the 2 preceding bits
5. $f_{8 \times 5 \text{bitSlidingXOR}}$
 - order-5 decomposable function
6. $f_{8 \times 5 \text{bitTrap}}$
 - order-5 decomposable function
 - interactions in each 5-bit block are very strong, the basis function is deceptive

Scalability analysis

Facts:

- Using small population size, population-based optimizers can solve only easy problems.
- Increasing the population size, the optimizers can solve increasingly harder problems.
- ...but using a too big population is wasting resources.

Summary

Scalability analysis

Facts:

- Using small population size, population-based optimizers can solve only easy problems.
- Increasing the population size, the optimizers can solve increasingly harder problems.
- ...but using a too big population is wasting resources.

Scalability analysis:

- Determines the optimal (smallest) population size, with which the algorithm solves the given problem reliably.
 - reliably: algorithm finds the optimum in 24 out of 25 runs
 - for each problem complexity, the optimal population size is determined e.g. using the bisection method
- Studies the influence of the problem complexity (dimensionality) on the optimal population size and on the number of needed evaluations.

Summary

NO! That's not true!

Why?

- In the beginning, the distribution patterns are not very discernible, models similar to uniform distributions are used.
- In the end, the population converges and contains many copies of the same individual (or a few individuals). No interactions among variables can be learned. Model structure is wrong (all bits independent), but the model describes the position of optimum very precisely.
- The model with the best matching structure is found somewhere in the middle of the evolution.
- Even though the right structure is never found during the evolution, the problem can be solved successfully.

Summary

Learning outcomes

After this lecture, a student shall be able to

- explain what an epistasis is and show an example of functions with and without epistatic relations;
- demonstrate how epistatic relationships can destroy the efficiency of the search performed by an optimization algorithm, and explain it using schemata;
- describe an Estimation-of-Distribution algorithm and explain its differences from an ordinary EA;
- describe in detail and implement a simple UMDA algorithm for binary representations;
- understand, fit to data, and use simple Bayesian networks;
- explain the commonalities and differences among EDAs not able to work with any interactions (PBIL, cGA, UMDA);
- explain the commonalities and differences among EDAs able to work with only pairwise interactions (MIMIC, COMIT, BMDA);
- explain the commonalities and differences among EDAs able to work with multivariate interactions (ECGA, BOA);
- explain the model learning procedures used in ECGA and BOA;
- understand what effect the use of a more complex model has on the efficiency of the algorithm when used on problems with increasingly hard interactions.
