

Heap in an array

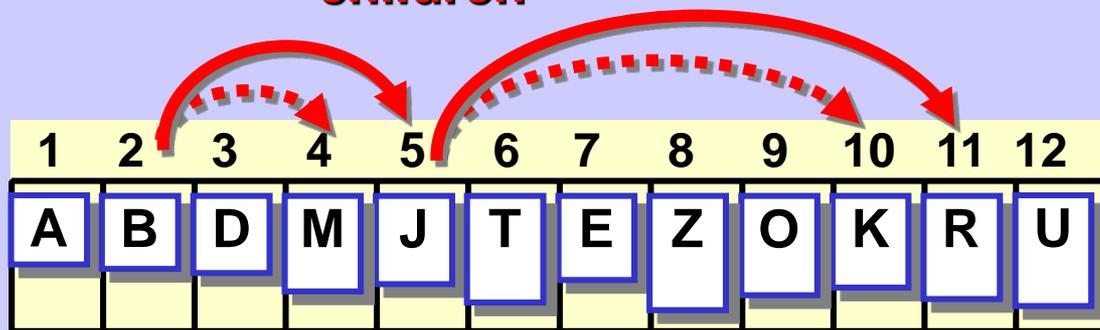

Heap stored in an array

children

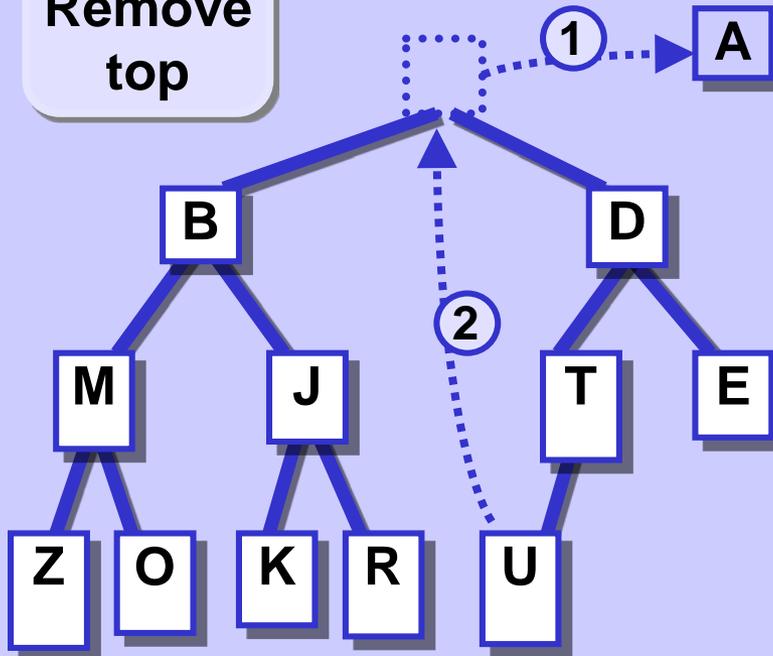

children

Heap repair

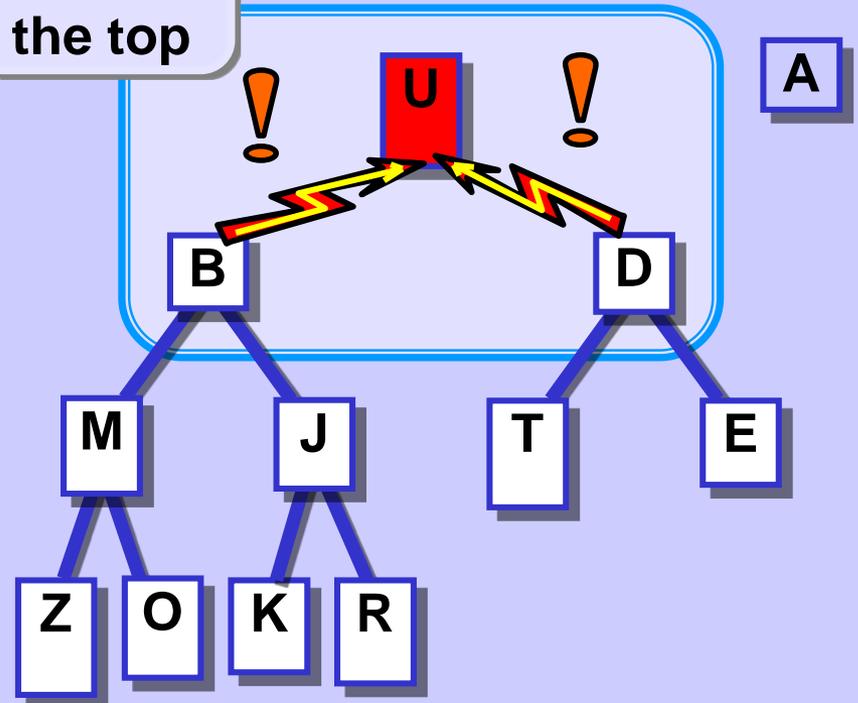

Top removed (1)

① Remove top

② last → first

③ Put at the top

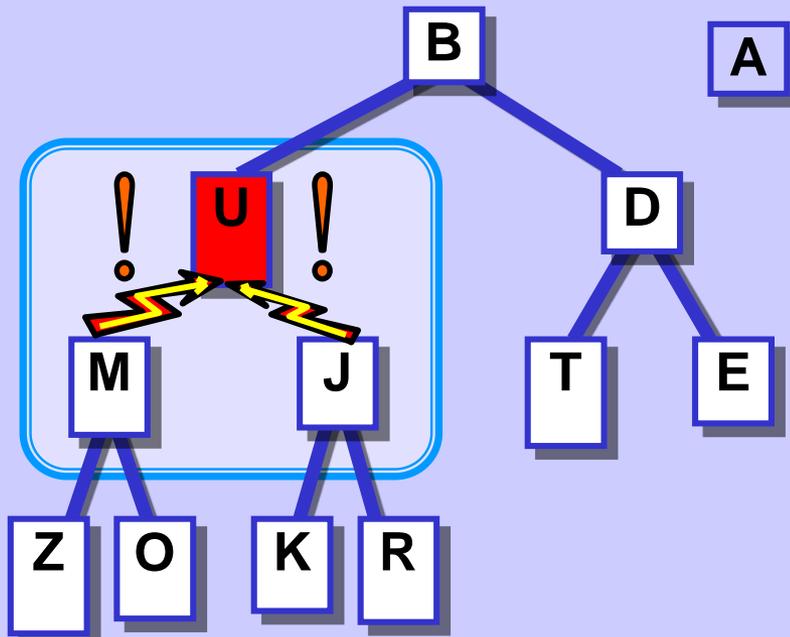

$U > B, U > D, \underline{B < D}$
 \Rightarrow swap $B \leftrightarrow U$

Heap repair

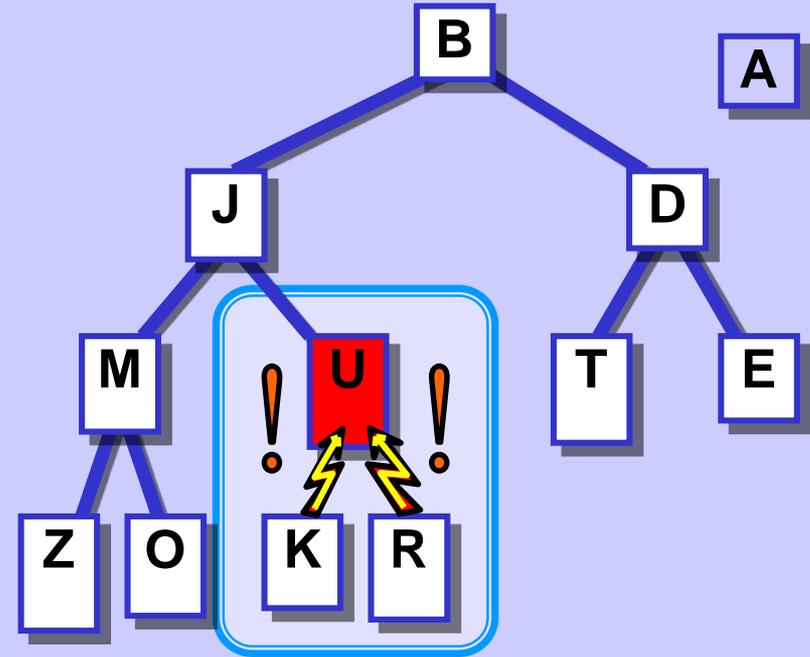

Top removed (2)

③

Put at the top - cont...

$U > M, U > J, \underline{J < M}$
 \Rightarrow swap $J \leftrightarrow U$

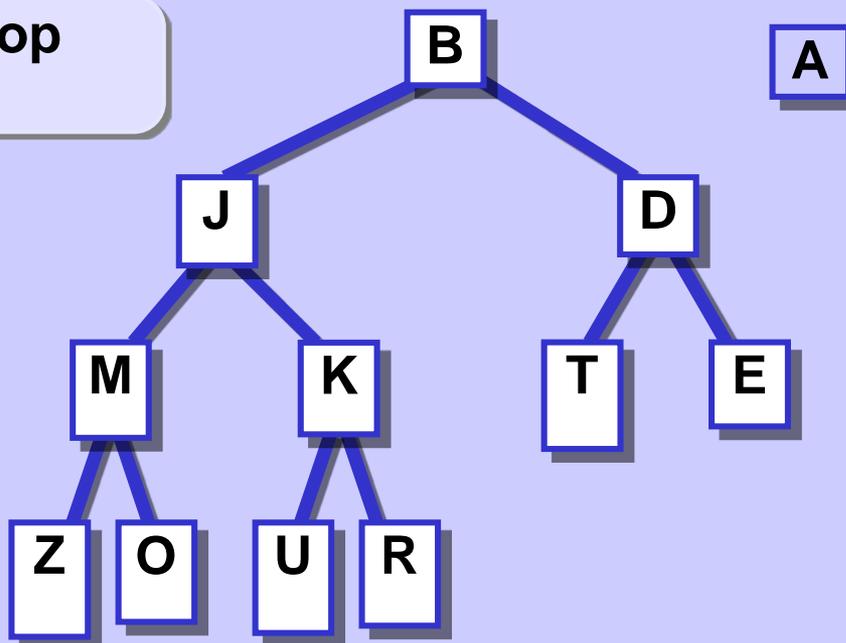

$U > K, U > R, \underline{K < R}$
 \Rightarrow swap $K \leftrightarrow U$

Heap repair

Top removed (3)

③ Put at the top
- done.

New heap

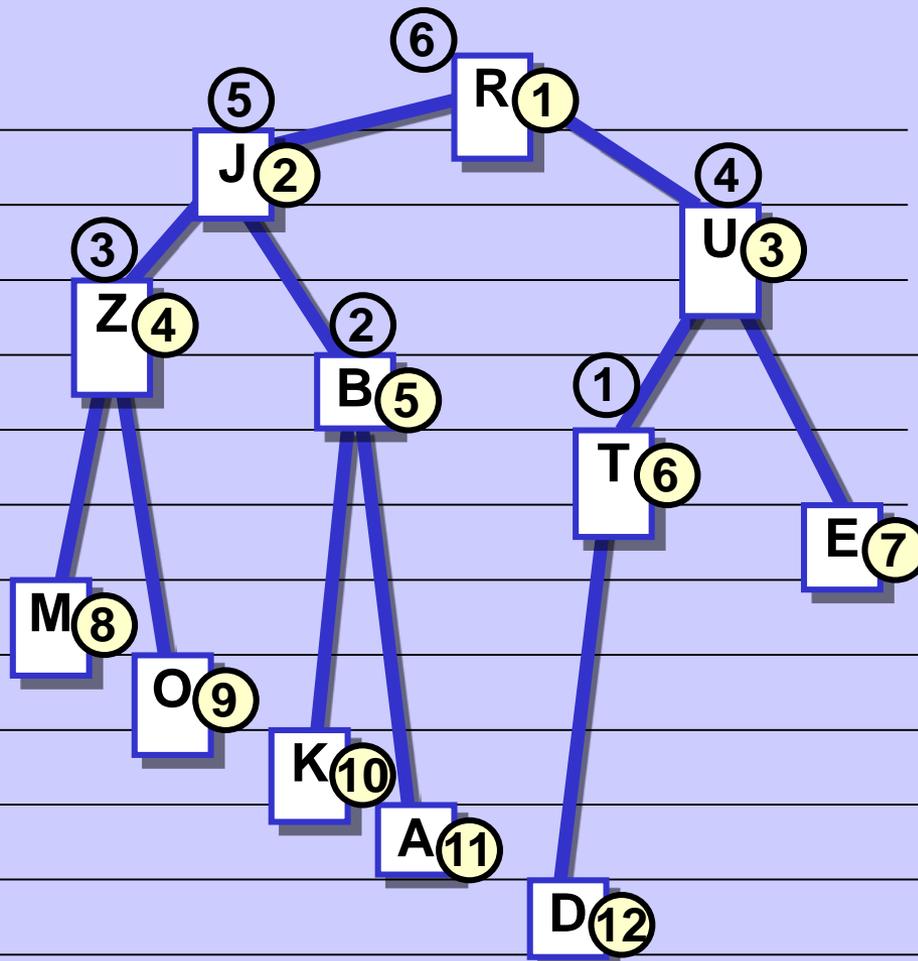

Make a heap -- Heapify

Array

⑥	1	R

Heapify

```
def repairTop (arr, top, bottom):  
    i = top      # arr[2*i] and arr[2*i+1]  
    j = i*2     # are successors of arr[i]  
    topVal = arr[top]  
    # try to find a successor < topVal  
    if j < bottom and arr[j] > arr[j+1]: j += 1  
    # while successors < topVal move successors up  
    while j <= bottom and topVal > arr[j]:  
        arr[i] = arr[j]  
        i = j; j = j*2      # move to next successor  
        if j < bottom and arr[j] > arr[j+1]: j += 1  
    # put topVal to its correct place  
    arr[i] = topVal  
  
def heapify (arr):  
    n = len(arr)-1  
    for i in range(n//2, 0, -1): # progress backwards!  
        repairTop(arr, i, n)
```

Priority queue implemented with binary heap -- Insert

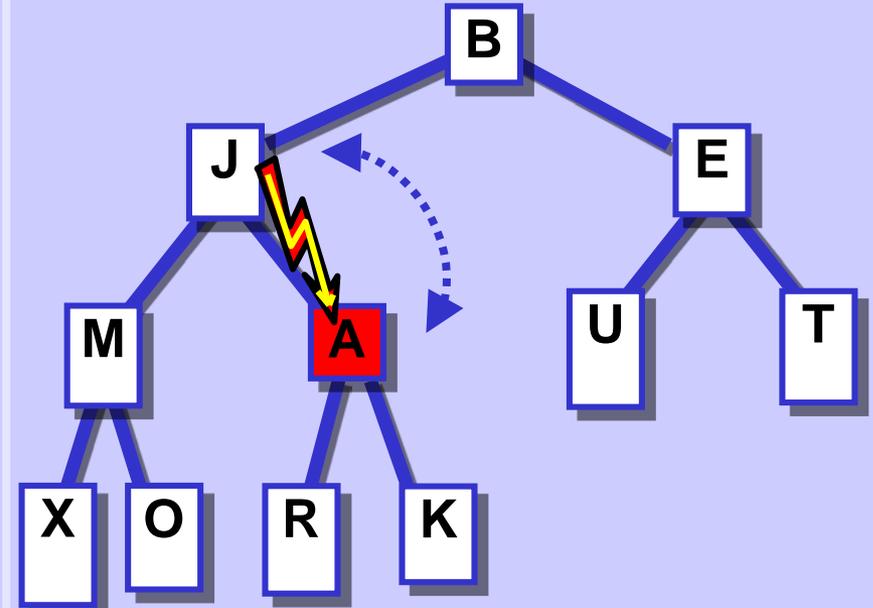

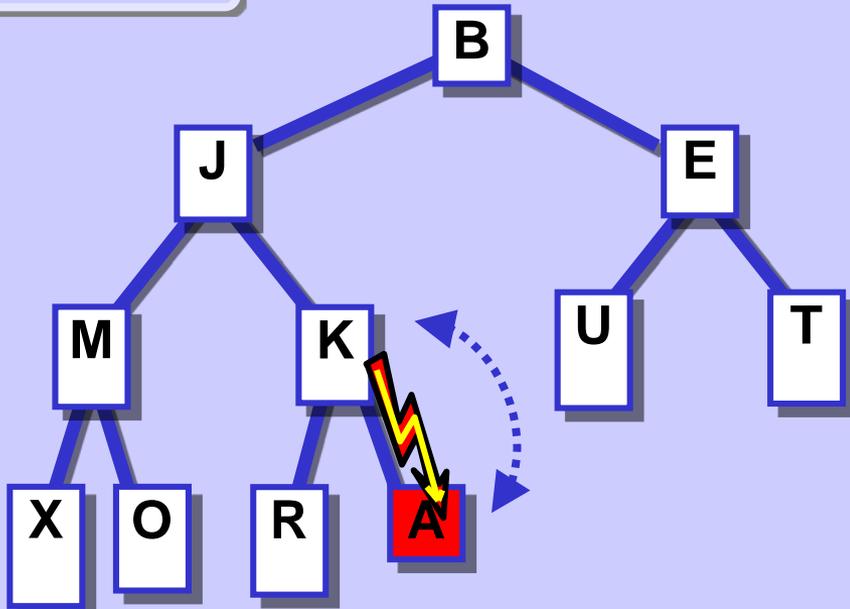

Insert the element at the end of the queue (end of the heap).

In most cases, this violates the heap property and the heap has to be repaired.

Priority queue implemented with binary heap -- Insert

Insert A

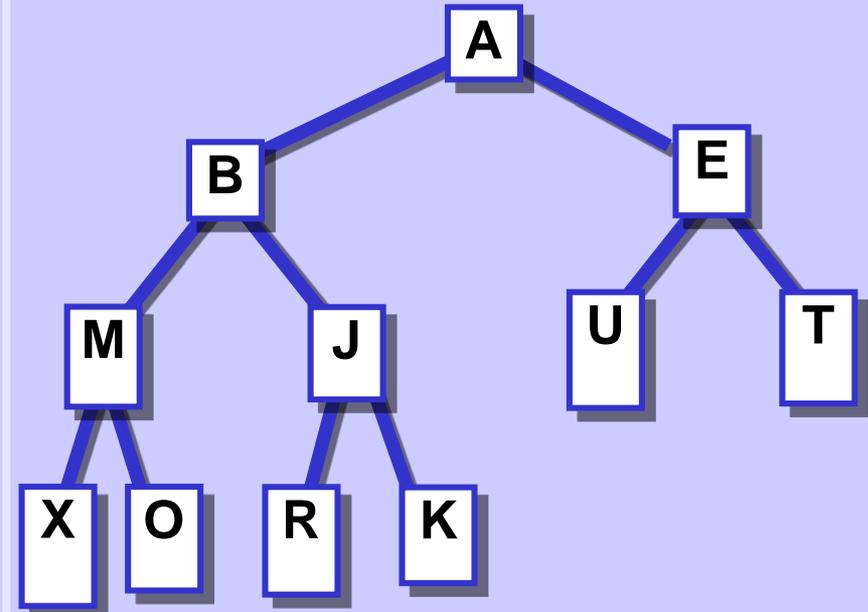

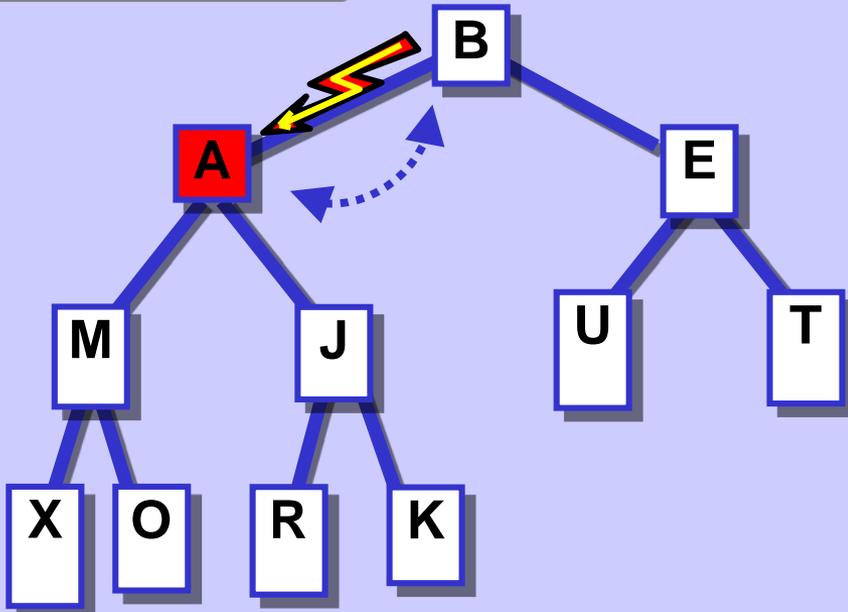

Heap property is violated,
swap the element with its parent.

Heap property is still violated,
swap the element with its parent.

Priority queue implemented with binary heap -- Insert

Inserting A

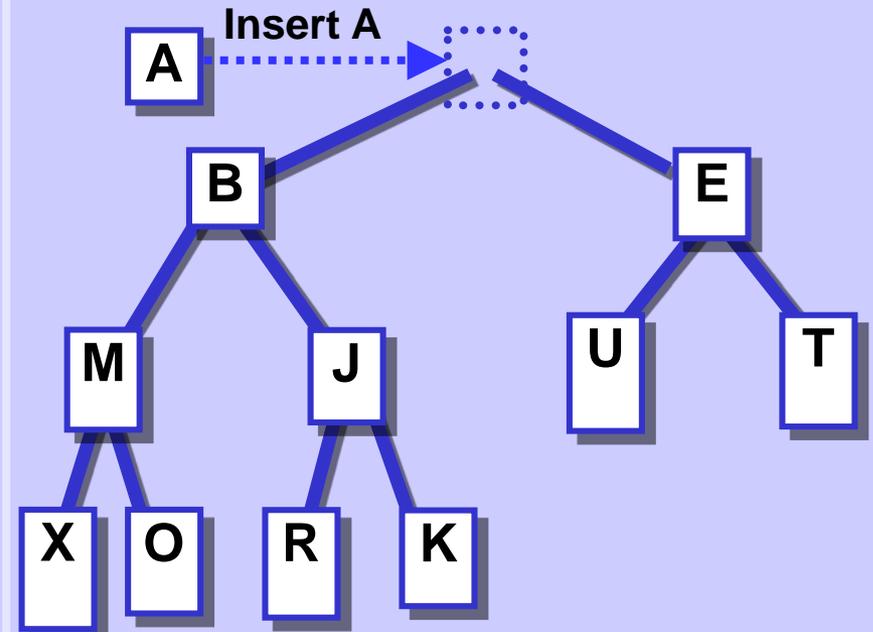

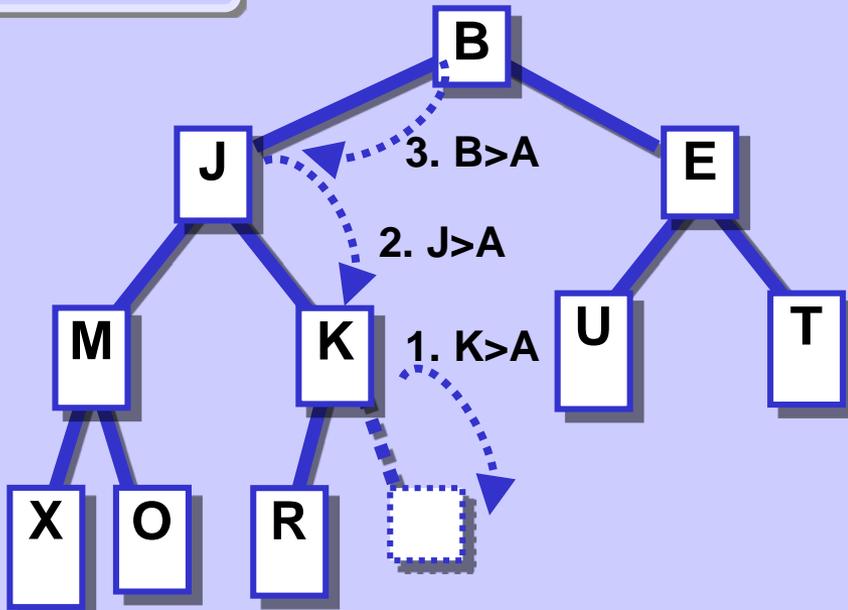

Heap property is still violated,
swap the element with its parent.

Heap property is respected,
the inserted element has found
its place in the queue (heap).

Binary heap -- Insert element more effectively

Insert A

Do not insert the element at the end of the queue.
First, find its place and while searching move down other elements encountered in the search.

Finally, store the inserted element at its correct position.

Binary heap – Insert

```
# beware! array is arr[1] ... arr[n]
# bottom == ndx of last elem
def heapInsert(arr, x, bottom):
    bottom += 1    # expand the heap space
    j = bottom
    i = j//2      # parent index

    while i > 0 and arr[i] > x:
        arr[j] = arr[i]    # move parent down the heap
        j = i; i //= 2    # move indices up the heap

    arr[j] = x    # put inserted elem to its place
    return bottom
```

Insert -- Complexity

Inserting represents a traversal in a binary tree from a leaf to the root in the worst case. Therefore, the Insert complexity is $O(\log_2(n))$.
