

PRG – PROGRAMMING ESSENTIALS

Lecture 1 – Introduction, variables, expressions

Milan Nemy

Czech Technical University in Prague,
Faculty of Electrical Engineering, Dept. of Cybernetics

<https://beat.ciirc.cvut.cz/people/milan-nemy/>

milan.nemy@cvut.cz

INTRODUCTION

LECTURES – Milan Nemy

milan.nemy@cvut.cz

<https://beat.ciirc.cvut.cz/people/milan-nemy/>

PC LABS – Pavel Sindler

pavel.sindler@fel.cvut.cz

THE GOAL!

- Develop skills with Python **fundamentals**
- Learn to **recognize and write** "good" Python
- Gain experience with **practical Python** tasks
- Understand **when** to choose Python (**or not!**)

THE WAY OF THE PROGRAM

Think like a computer scientist

- Combines:
 - mathematics (**formal language to denote ideas**)
 - engineering (**analysis, synthesis, systems, tradeoffs**)
 - natural science (**observe, hypothesis, test predictions**)
- Problem solving!
 - formulate problems
 - think about solutions
 - implement solutions clearly & accurately

PROBLEM SOLVING!

- Problem formulation (**input / output**)
- Formalism (**math?**)
- Algorithm (**steps**)
- Implementation (**engineering**)
- Testing (**are we good?**)

EXAMPLE – THE PROBLEM!

Problem formulation

Find a pair of numbers from a given list of N integers (both **sorted** and **unsorted**) such that their sum is exactly as given (in our case 8).

Examples

[1, 2, 3, 9] where $SUM = 8$... negative case

[1, 2, 4, 4] where $SUM = 8$... positive case

source: https://www.youtube.com/watch?v=XKu_SEDAykw

EXAMPLE – THE PROBLEM!

1. Solution for sorted list: **quadratic** complexity using **exhaustive search**
2. Solution for sorted list: **$n \cdot \log(n)$** complexity using unidirectional **binary search** (halving the interval) for the complement
3. Solution for sorted list: **linear** complexity using **comparing lower and upper bound** such that if $< \text{SUM}$ increase lower and if $> \text{SUM}$ decrease upper index (*smallest possible sum first two, largest possible sum last two*)
4. Solution for unsorted list: build list of previously visited complements and compare for a match while iterating (*hash table with constant time for look-up*)
5. Final touch – edge cases, empty list

COURSE ADMINISTRATION

week	date	topic	materials
1.	27.09.2024	Introduction. Variables, expressions.	
2.	04.10.2024	Primitive data types, program flow	
3.	11.10.2024	Program structure, functions	
4.	18.10.2024	Sequence data types, traversals	
5.	25.10.2024	Collections (sets, dictionaries), iterators	
6.	01.11.2024	Modules, namespaces, conventions	
7.	08.11.2024	Mid-term test	
8.	15.11.2024	Filesystem, file reading and writing	
9.	22.11.2024	Debugging, code testing, exceptions	
10.	29.11.2024	Objects, classes I	
11.	06.12.2024	Objects, classes II	
12.	13.12.2024	Objects, classes III	
13.	20.12.2024	Advanced concepts	
14.	10.01.2025	Revision for the exam	

Topic number	date (Thu)	date (Fri)	content
1.	26.09.2024	27.09.2024	First steps, introduction to IDE, weekly homework
2.	03.10.2023	04.10.2023	Variables, conditionals
3.	10.10.2023	11.10.2023	Functions, error and exceptions
4.	17.10.2023	18.10.2023	Iterables - strings, tuples, lists
5.	24.11.2023	25.10.2023	Non-trivial loops, iterators, sets, dictionaries
6.	30.10.2023	01.11.2023	Modules, namespaces, conventions
7.	07.11.2023	08.11.2023	Comprehensive exercises
8.	14.11.2023	15.11.2023	Files
9.	21.11.2023	22.11.2023	Debugging, code testing, exceptions
10.	28.12.2023	29.12.2023	Objects and classes I - class method, static method, property, instances as return values
11.	05.12.2023	06.12.2023	Objects and classes II - dot operator composition, equality, object copy, operator overloading
12.	12.12.2023	13.12.2023	End-of-term test
13.	19.12.2024	20.12.2024	Object and classes III - comprehensive exercises
14.	09.01.2025	10.01.2025	Unittest, exceptions, list comprehensions+ Comprehensive exercises

COURSE ADMINISTRATION

Grading

Points: 50 homework (mostly coding), 20 tests during the term (2 tests, 10 points each), 30 final exam.

At least 30 points (out of 70) and regular lab attendance are needed before going to the final exam (in order to obtain "zapocet"). At least 10 points (out of 30) are needed to pass the final exam. To pass the course and get a grade, "zapocet" must be obtained, exam passed and at least 51 points gained in total (see the table below). It is possible to get additional up to 20 points for extra activity during the semester, such as completing a bonus homework.

A	B	C	D	E	F
100-91	90-81	80-71	70-61	60-51	50-0

F means fail.

- Lectures and computer labs
- Graded homework assignments
- Weekly assignments
- Tests (2x)
- Final exam test
- Extra points: *activity, finding bugs, errors ...*
- Automatic evaluation & plagiarism detection

COURSE ADMINISTRATION

PLAGIARISM WARNING

https://cw.fel.cvut.cz/wiki/help/common/plagiarism_cheating

Plagiarism

It is required that all work you submit in this course is original and your own. It is not allowed to copy homework solutions from other students or from the internet, to provide your homework solutions to other students, or to publish them on the internet. You may freely discuss your solutions with other students, but **code sharing is prohibited**. See [plagiarism_cheating](#) for more details.

It is your responsibility that you do not share your code. In case of discovery, the person who provided the code is punished as well. Sufficient evidence of plagiarism is even when a student is unable to explain how his code works.

There are very strict punishments with regard to plagiarism and cheating during tests and exams. The first discovered plagiarism/cheating leads to zero points from the assignment/test. In case of an assignment, it is further necessary to submit a new, original, solution for zero points. The second occurrence means an F from the course and any subsequent plagiarism/cheating leads to disciplinary actions at the faculty level. It is important to note that every discovered plagiarism/cheating gets into your record – the plagiarism/cheating occurrences are counted cumulatively across all courses during your studies.

COURSE ADMINISTRATION

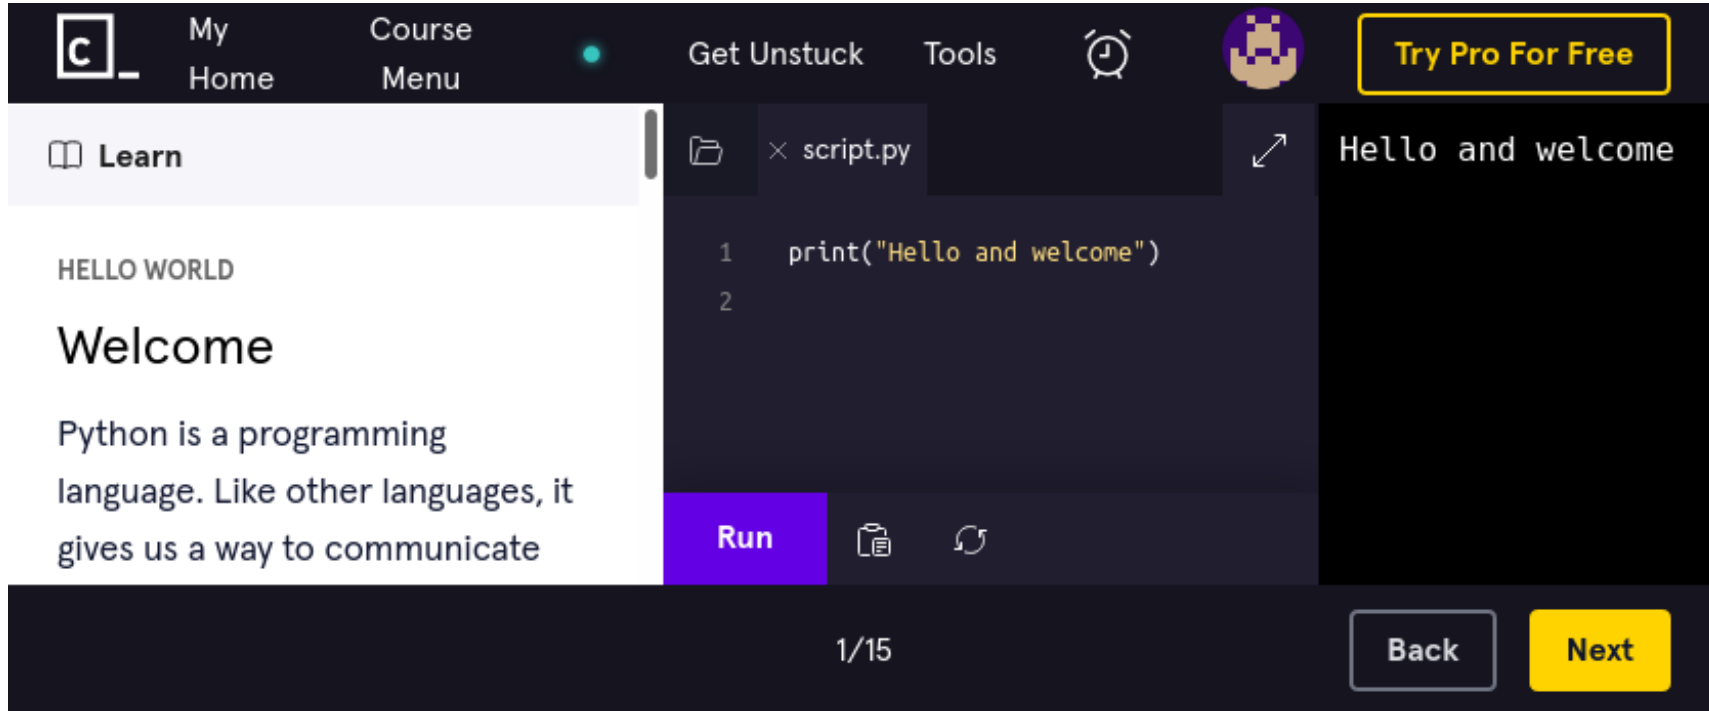

Exams and Tests

There will be two tests during the semester (mid-term and end-of-term) and a final exam during the exam period. The format of both the exam and the mid-term/end-of-term tests will be specified during the semester.

The content of the exam / test will be based on the content of:

1. Lectures before the date of the exam / test (not limited but including the slides released after each lecture)
2. Exercises and home-works practiced before the date of the exam / test
3. Relevant chapters of the [Wentworth2012](#) book
4. Collection of Python multiple-choice question to practice for the exam <http://www.sanfoundry.com/1000-python-questions-answers/> related to the content of the lectures

COURSE ADMINISTRATION

The screenshot displays a course administration interface. At the top, there is a navigation bar with a 'C' logo, 'My Home', 'Course Menu', 'Get Unstuck', 'Tools', a clock icon, a user profile icon, and a 'Try Pro For Free' button. Below the navigation bar, the interface is split into three main sections. On the left, a 'Learn' sidebar contains a 'HELLO WORLD' section and a 'Welcome' section with the text: 'Python is a programming language. Like other languages, it gives us a way to communicate'. In the center, a code editor shows a file named 'script.py' with two lines of Python code: '1 print("Hello and welcome")' and '2'. Below the code editor is a purple 'Run' button and icons for file operations. On the right, a terminal window displays the output 'Hello and welcome'. At the bottom of the interface, there is a progress indicator '1/15' and 'Back' and 'Next' buttons.

WHY PYTHON?

According to <https://www.techrepublic.com> ...

1. **Ease of learning** - one of the easiest programming languages to learn, known for high reliability and simple syntax (rapid prototyping, steep learning curve)

2. **The explosion of AI, machine learning, and data science in the enterprise**

(<https://www.tensorflow.org> , <https://www.scipy.org> , <http://scikit-learn.org/stable/> ,
<http://playground.arduino.cc/Interfacing/Python> , ...)

3. **Large developer community** - available for many operating systems, often used to command other programs

Source: <https://www.techrepublic.com/google-amp/article/why-python-is-so-popular-with-developers-3-reasons-the-language-has-exploded/>

WHY PYTHON?

Sep 2024	Sep 2023	Change	Programming Language	Ratings	Change
1	1		 Python	20.17%	+6.01%
2	3	▲	 C++	10.75%	+0.09%
3	4	▲	 Java	9.45%	-0.04%
4	2	▼	 C	8.89%	-2.38%
5	5		 C#	6.08%	-1.22%

COMPANIES USING PYTHON

Companies using python #1: Google: The company that needs no introduction, Google. Its video platform Youtube is all written on python!

Companies using python #2: Instagram: An image sharing platform was a simple language developed on Django (Python framework) before it was acquired by Facebook.

Companies using python #3: Netflix: The video streaming platform offer suggestions to its users constantly. Do you know what makes this possible. Yes, it's THE PYTHON!

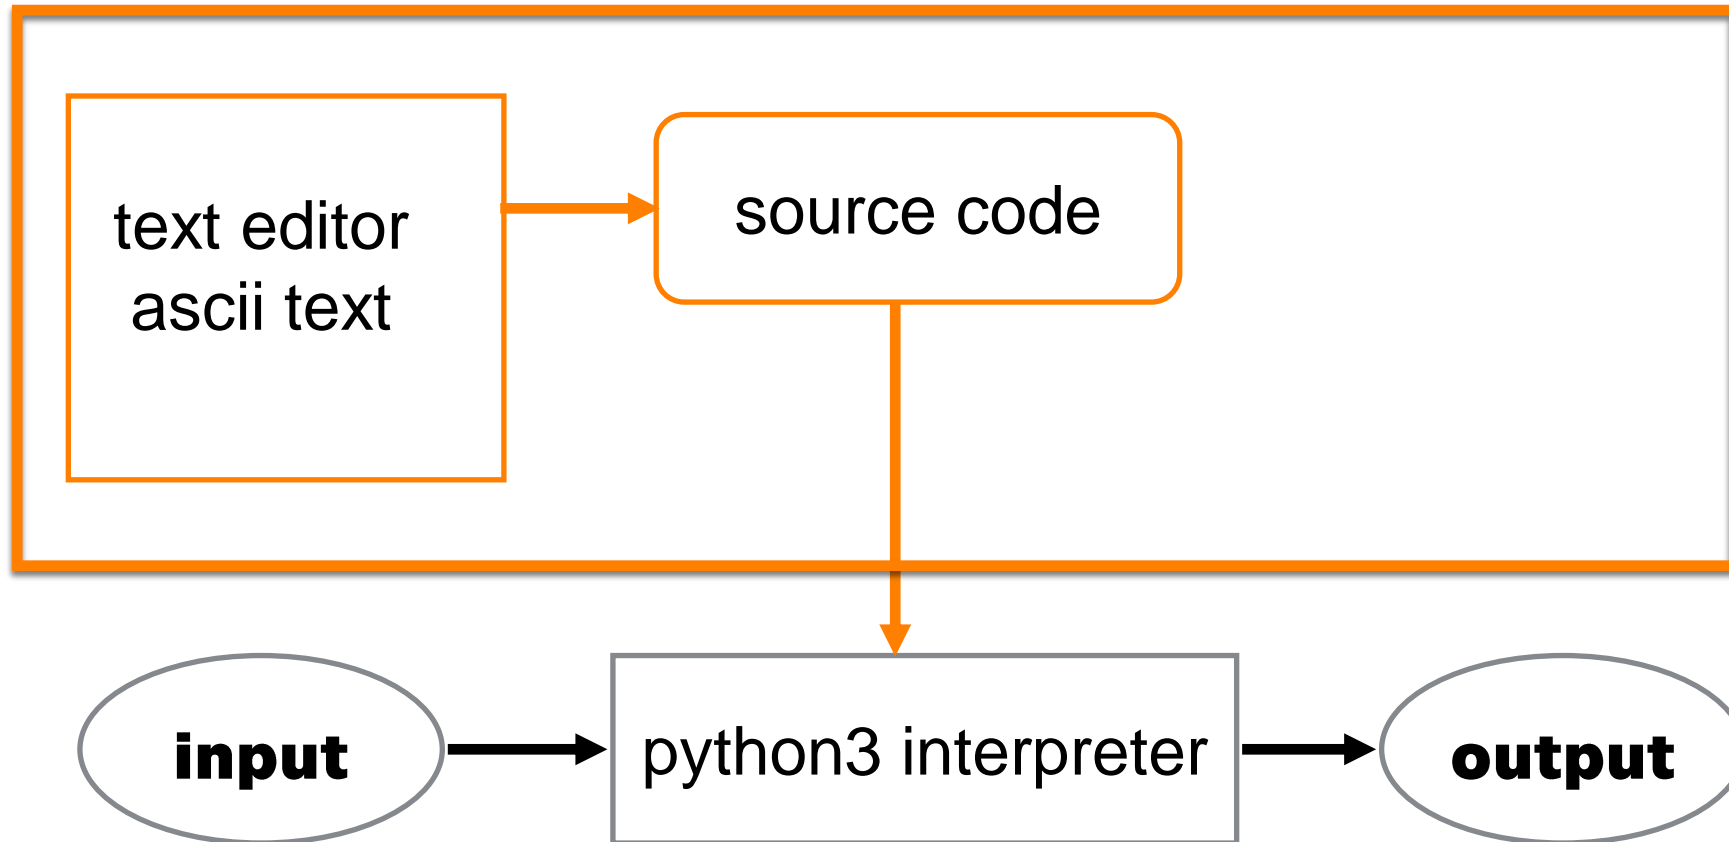

Companies using python #4: Facebook: According to the official blog from facebook, 21% of facebook codebase is based on Python.

THE PROGRAM

- **Program** is a sequence of instructions that specifies how to perform a computation.
- **Input** - get data from the keyboard, a file, device ..
- **Output** - display data on the screen or send data to a file or other device (client/server, local/remote).
- **Math** - perform mathematical operations (**algorithms**)
- **Conditional execution** - Check for certain conditions and execute the appropriate sequence of statements.
- **Repetition** - Perform some action repeatedly

OUR PROGRAM

PYTHON INTERPRETER

Entering commands – in several modes:

1. Immediate mode using python console (quick testing)
2. Script mode using IDE or text editor (development)
3. IPython Notebook (presentation)

PYTHON INTERPRETER

TIME TO CODE!

THE ZEN OF PYTHON

```
michalreinstein@MacBook-Pro:~$~ $ python3
Python 3.6.2 (default, Sep 21 2017, 00:54:38)
[GCC 4.2.1 Compatible Apple LLVM 8.1.0 (clang-802.0.42)] on darwin
Type "help", "copyright", "credits" or "license" for more information.
>>> import this
The Zen of Python, by Tim Peters

Beautiful is better than ugly.
Explicit is better than implicit.
Simple is better than complex.
Complex is better than complicated.
Flat is better than nested.
Sparse is better than dense.
Readability counts.
Special cases aren't special enough to break the rules.
Although practicality beats purity.
Errors should never pass silently.
Unless explicitly silenced.
In the face of ambiguity, refuse the temptation to guess.
There should be one-- and preferably only one --obvious way to do it.
Although that way may not be obvious at first unless you're Dutch.
Now is better than never.
Although never is often better than *right* now.
If the implementation is hard to explain, it's a bad idea.
If the implementation is easy to explain, it may be a good idea.
Namespaces are one honking great idea -- let's do more of those!
>>>
```

WHAT IS PYTHON?

Integrated Development Environment, IDE

Python program, code,
expressions

Python interpreter

Operating System
MS Win, Mac OSX, Linux

computer - hw

DEBUGGING – HUNTING ERRORS

Syntax errors

- Formal tokens & structure of the code must obey rules (IDE)
- Python executes only syntactically correct code

Runtime errors

- Discovered during runtime (program fails!)
- Exceptions – something exceptional happens (we can catch and handle exceptions!)

Semantic errors

- The meaning of the program (semantics) is wrong
- Program runs but does something different than we want

DATA TYPES

```
>>> type("Hello, World!")  
<class 'str'>  
>>> type(17)  
<class 'int'>
```

```
>>> type(3.2)  
<class 'float'>
```

```
>>> type("17")  
<class 'str'>  
>>> type("3.2")  
<class 'str'>
```

Strings in Python can be enclosed in either single quotes (') or double quotes ("), or three of each (''' or """)

```
>>> type('This is a string.')
```

```
<class 'str'>  
>>> type("And so is this.")  
<class 'str'>  
>>> type("""and this.""")  
<class 'str'>  
>>> type('''and even this...''')
```

```
<class 'str'>
```

- Integers (int) 1, 10, 124
- Strings (str) "Hello, World!"
- Float (float) 1.0, 9.999

source http://openbookproject.net/thinkcs/python/english3e/variables_expressions_statements.html

VARIABLES

The **assignment statement** gives a value to a variable:

```
>>> message = "What's up, Doc?"
>>> n = 17
>>> pi = 3.14159
>>> message
'What's up, Doc?'
>>> n
17
>>> pi
3.14159
```

```
>>> day = "Thursday"
>>> day
'Thursday'
>>> day = "Friday"
>>> day
'Friday'
>>> day = 21
>>> day
21
```

- We use variables to **remember** things!
- Do not confuse = and == !
 - = is **assignment** token such that *name_of_variable = value*
 - == is operator to **test equality**
- Key property of a variable that we can change its value
- Naming convention: **with freedom comes responsibility!**
- Illegal name causes a **syntax error**
(variable name must begin with letter or underscore _)

VARIABLES

cannot begin with a number

```
>>> 76trombones = "big parade"  
SyntaxError: invalid syntax
```

this \$ is illegal character

```
>>> more$ = 1000000  
SyntaxError: invalid syntax
```

class is reserved keyword

```
>>> class = "Computer Science 101"  
SyntaxError: invalid syntax
```

- We use variables to **remember** things!
- Do not confuse = and == !
 - = is **assignment** token such that *name_of_variable = value*
 - == is operator to **test equality**
- Key property of a variable that we can change its value
- Naming convention: **with freedom comes responsibility!**
- Illegal name causes a **syntax error** (begin with letter or _)

KEYWORDS

and	as	assert	break	class	continue
def	del	elif	else	except	exec
finally	for	from	global	if	import
in	is	lambda	nonlocal	not	or
pass	raise	return	try	while	with
yield	True	False	None		

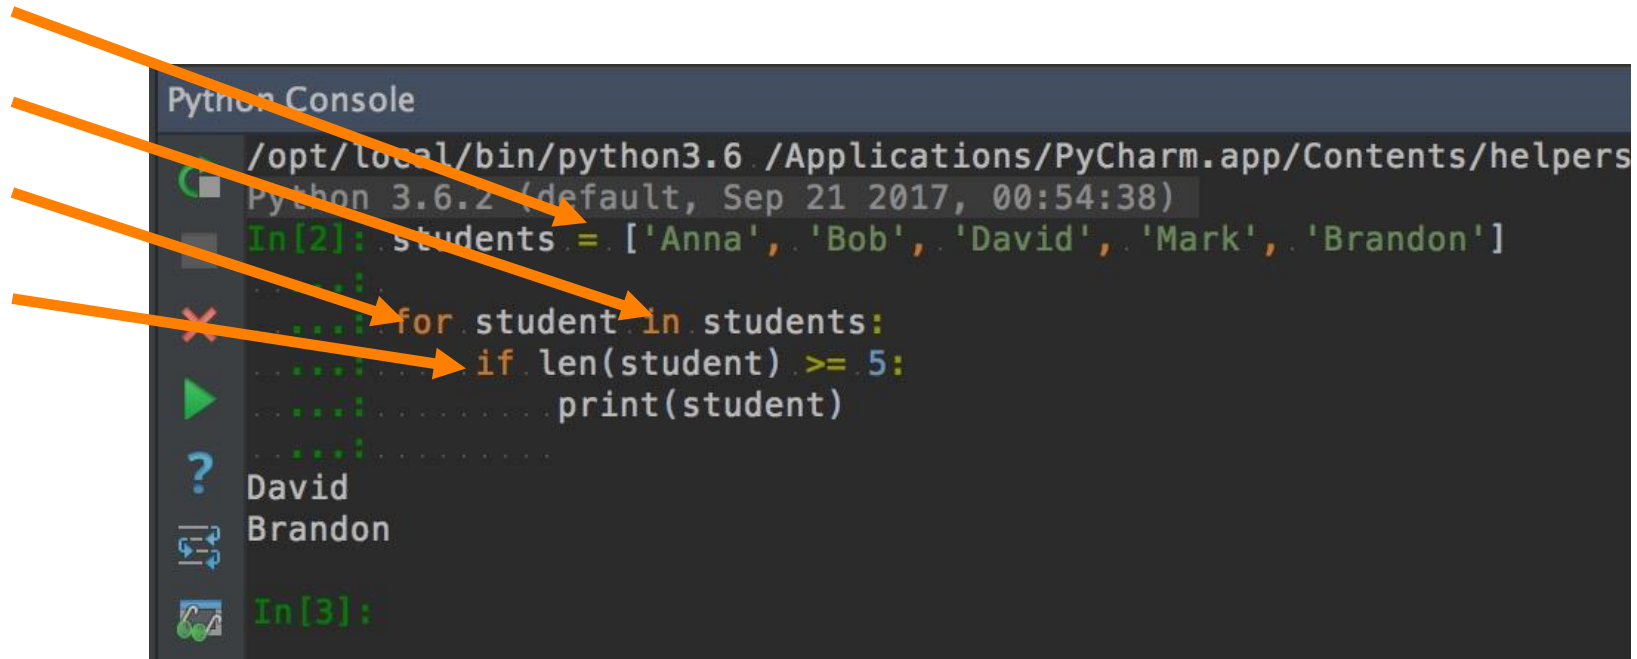

- Python keywords have **special** purpose
- Always choose names **meaningful** to human readers
- Use **comments** to improve readability and clarity

COMMENTS

```
1 #-----  
2 # This demo program shows off how elegant Python is!  
3 # Written by Joe Soap, December 2010.  
4 # Anyone may freely copy or modify this program.  
5 #-----  
6  
7 print("Hello, World!")      # Isn't this easy!
```

- Big & complex programs == difficult to read
- Comments and blank lines are for human readers only, ignored by the interpreter
- Use this token **#** to start a comment
- Use **blank lines** to make the code visually more appealing

STATEMENTS

```
Python Console
/opt/local/bin/python3.6 /Applications/PyCharm.app/Contents/helpers
Python 3.6.2 (default, Sep 21 2017, 00:54:38)
In[2]: students = ['Anna', 'Bob', 'David', 'Mark', 'Brandon']
In[3]: for student in students:
        if len(student) >= 5:
            print(student)
? David
Brandon
In[3]:
```

- Statement is an **instruction** executable in Python
- Statements **do not produce any results**
- So far only assignment statements =
- Statement examples: *for, in, if ...*

EXPRESSIONS

```
Python Console
/opt/local/bin/python3.6 /Applications/PyCharm.app/Contents/helpers
Python 3.6.2 (default, Sep 21 2017, 00:54:38)
In[2]: students = ['Anna', 'Bob', 'David', 'Mark', 'Brandon']
.....:
.....: for student in students:
.....:     if len(student) >= 5:
.....:         print(student)
.....:
? David
Brandon
In[3]:
```

- Expression is a combination of **values**, **variables**, **operators**, and **calls** to functions
- Built-in Python functions: *len*, *type*, *print*
- Value by itself is an expression
- Expression **produces result** (right side of an assignment)
