- always recommend to work in a **Virtual Environment**
- it stores copies of the particular dependencies locally
- one solution to a **dependency hell**

Dependencies (requirements.txt)

```
1 numpy==2.3.3
2 matplotlib==3.10.6
3 scikit-learn==1.7.2
4 pandas==2.3.2
5 jupyter
6 jupyterlab-vim
7 wandb
8 transformers # huggingface
9 drawdata # drawing datasets
```

- the version is fixed for some of the packages to make the code within the examples work in the future

Setting up python environment (Ubuntu 24.04)

```
1 # install the python3's virtual environment
2 sudo apt get install python3-venv
3
4 # create the virtual environmetn
5 python3 -m venv python-env
6
7 # activate the environment
8 source ./python-env/bin/activate
9
10 # install dependencies manually
11 pip install numpy ...
```

or install dependencies in bulk

```
1 # install deps from requirements.txt
2 python3 -m pip install -r requirements.txt
```

- web-interface with an editor
- allows execution of portions of your code
- remembers the state of variables
- remembers where you left it
- embedded visualization
- well-suited for learning and prototyping
- (bonus) vim-like key bindings
- **Jupyter Notebook**
 - single document, simple
- **Jupyter Lab**
 - multiple documents at once
 - similar to an IDE
 - better file management

Running Jupyter Notebook

```
1 # 1. activate your python env
2 source ./python-env/bin/activate
3
4 # 2. run
5 jupyter notebook
```

3. check your browser (localhost:8888)

Running Jupyter Lab

```
1 # 1. activate your python env
2 source ./python-env/bin/activate
3
4 # 2. run
5 jupyter lab
```

3. check your browser (localhost:8888)

CUDA

- Parallel computing in general
- vendor locked-in: Nvidia is dominating the market
- For ML: The more GPU memory you have, the better

Alternatives

- **OpenCL**
 - AMD, Intel and NVidia
 - lower performance
 - worse toolbox support
- **Vulcan**
 - mode focused on running than training
 - supports all HW platforms

Share of deep learning libraries

source: <http://paperswithcode.com> [not available anymore]

PyTorch

- developed by Meta
- favored amongst researchers
- great for prototyping
- limited deployment capabilities
- Python-only API
- Dominance within “casuals”

Tensorflow

- developed by Google
- aimed at production
- models for end-user devices
- graph-based paradigm
- APIs:
 - Python, C++, JavaScript, Java (?)

JAX

- developed by Google
- rising star for research
- functional programming
- more *focused* on HPC
- Python-only API (Numpy-like)
- Steeper learning curve than PyTorch

Install command generator for *my machine*

PyTorch Build	Stable (2.8.0)		Preview (Nightly)	
Your OS	Linux	Mac	Windows	
Package	Pip	LibTorch	Source	
Language	Python		C++ / Java	
Compute Platform	CUDA 12.6	CUDA 12.8	CUDA 13.0	ROCm 7.0 CPU
Run this Command:	pip3 install --pre torch torchvision --index-url https://download.pytorch.org/whl/nightly/cu130			

pip installation for CPU

```
1 source ./python-env/bin/activate
2
3 pip3 install --pre torch torchvision --
  index-url https://download.pytorch.org/
  whl/nightly/cu130
```

pip installation for CUDA 13.0

```
1 source ./python-env/bin/activate
2
3 pip3 install --pre torch torchvision --
  index-url https://download.pytorch.org/
  whl/nightly/cpu
```

Representing multi-dimensional data

- tensors are generalization of n-dimensional matrices (scalars, vectors, matrices, n-dimensional tensor, ...)
- propagation of information in deep learning (DL) linear layers is modeled by tensor operations:

$$\mathbf{y} = \mathbf{Ax} + \mathbf{b},$$

where $x \in \mathbb{R}^n$ is the layer's input tensor (vector),
 $y \in \mathbb{R}^m$ is the layer's output tensor (vector),
 $\mathbf{A} \in \mathbb{R}^{n \times m}$ is the tensor (matrix) of weights and
 $\mathbf{b} \in \mathbb{R}^m$ is the tensor (vector) of biases.

- hardware is capable of efficient evaluation of tensor operations
 - GPUs (CUDA)
 - TPUs (tensor processing units, ASICs)

Tensor dimensionality

- 0D tensor (scalar): $a = 3.14$
 - loss value, a single weight
- 1D tensor (vector): $\mathbf{a} = [3, 2, 1]^T$
 - feature vector, embedding vector
- 2D tensor (matrix): $\mathbf{A} = \begin{bmatrix} 2, 1, \\ 1, -3 \end{bmatrix}$
 - weight matrix, images (greyscale)
- 3D tensor: $\mathbb{A} = \left[\begin{bmatrix} 2, 1, \\ 1, -3 \end{bmatrix}, \begin{bmatrix} -1, 2, \\ 0, 1 \end{bmatrix} \right]$
 - batch of images (grayscale), color image, video (grayscale)
- 4D tensor:
 - video (colored), batch of color images

Tensors in PyTorch

Example definition of tensors

```
1 import torch
2
3 # 1D tensor (row)
4 x = torch.tensor([1, 2])
5
6 # 1D tensor (column)
7 x = torch.tensor([1, 2]).view(-1, 1)
8
9 # 2D tensor (per row)
10 x = torch.tensor([[1, 2],
11                   [3, 4]])
```

Operations with tensors

- reshaping: `view`, `reshape`
- math: element-wise operations, tensor-wise operations (broadcasting)
- automatic tracking of gradients

Moving tensor to the GPU device

```
1 import torch
2
3 if torch.accelerator.is_available():
4     device = torch.accelerator.
5         current_accelerator().type
6 else:
7     device = "cpu"
8
9 # 2D tensor (per row)
10 x = torch.tensor([[1, 2],
11                   [3, 4]]).to(device)
```

Moving tensor back to CPU

```
1 import torch
2
3 x_cpu = x.cpu()
```

XOR classification task

- linearly non-separable classes
- can not be solve by purely linear classification (SVM, perceptron)
- solutions within classical ML:
 - lifting to higher dimensions (+ x_1x_2)
 - decision tree
 - kernel SVM

Jupyter Notebook

The following part of the lecture is accompanied by

`01_pytorch_xor_simple.ipynb`

XOR classification

Solving XOR using PyTorch and MultiLayer Perceptron (MLP)

1. Imports

```
1 import numpy as np
2 import matplotlib.pyplot as plt
3 import pandas as pd
4
5 import torch
6 from torch import nn
7 from torch import optim
8 from torch.autograd import Variable
```

- will be the same in all following examples

2. NN structure

```
1 class NeuralNetwork(nn.Module):
2     def __init__(self):
3
4         super().__init__()
5
6         self.linear1 = nn.Linear(2, 3)
7         self.sig1 = nn.Sigmoid()
8         self.linear2 = nn.Linear(3, 1)
9
10    def forward(self, x):
11
12        x = self.linear1(x)
13        x = self.sig1(x)
14        x = self.linear2(x)
15
16        return x
```

- 1 input layer, hidden layer, 1 output layer
- sigmoid activation before the hidden layer

3. prepare the model

```
1 # instantiate the model
2 model = NeuralNetwork()
3
4 # randomize weights before learning
5 for m in model.modules():
6     if isinstance(m, nn.Linear):
7         m.weight.data.normal_(0, 1)
```

4. prepare optimization task

```
1 # prepare loss function
2 loss_func = nn.MSELoss()
3
4 # prepare optimizer
5 optimizer = optim.SGD(
6     model.parameters(),
7     lr=0.02
8 )
```

5. create a XOR training set

```
1 X = torch.Tensor(
2     [[0, 0],
3      [0, 1],
4      [1, 0],
5      [1, 1]])
6
7 # two classes
8 y = torch.Tensor(
9     [0,
10     1,
11     1,
12     0]
13 ).view(-1, 1)
```

6. learning loop

```
1  for i in range(1000):
2
3      # forward pass
4      pred = model(X)
5
6      # reset gradients
7      optimizer.zero_grad()
8
9      # calculate the loss
10     loss = loss_func.forward(pred, y)
11
12     # calculate gradients
13     loss.backward()
14
15     # update the weights
16     optimizer.step()
17
18     if i % 100 == 0:
19         print("epoch {} loss {}".format(i, loss))
```

7. learning

```
1  epoch 0 loss 0.477
2  epoch 100 loss 0.228
3  epoch 200 loss 0.202
4  epoch 300 loss 0.172
5  epoch 400 loss 0.135
6  epoch 500 loss 0.084
7  epoch 600 loss 0.033
8  epoch 700 loss 0.007
9  epoch 800 loss 0.001
10 epoch 900 loss 0.000
```

Hugging-
face

- We created a training dataset including labels.
- We Designed out *deep learning model* (quite shallow now).
- We set up the loss function and an optimization method.
- We executed the learning step 1000x times.
- We used the model to predict a class for new data.

More complex XOR task

Simple ANN

Complex
XOR

Monitoring
Hyperopt

Hugging-
face

deeper XOR classification task

- non-singular classes
- dataset needs scaling
- decision boundaries not linear
- more training data
 - might need splitting to batches
- might benefit from running using CUDA

Jupyter Notebook

The following part of the lecture is accompanied by

`02_pytorch_xor_medium.ipynb`

XOR classification

Dataset preprocessing

- PyTorch does not contain complex Pipeline with preprocessing like Sklearn
- We are supposed to get the preprocessing done ourselves
- Let's use Sklearn again
 - `QuantileTransformer()`

Code

```
1 scaler =  
2     QuantileTransformer(  
3         n_quantiles=10)  
4 scaler.fit(X)  
5 X_transformed =  
6     scaler.transform(X)
```

XOR classification

Batches

- proper batch size is important:
- too large:
 - data might not fit into memory
 - the model might generalize poorly
- too small:
 - many learning steps with an epoch

Code

```
1  # convert the transformed dataset to tensors
2  X_tens = torch.tensor(X_transformed).to(torch.float32)
3  y_tens = torch.tensor(y).to(torch.float32).view(-1, 1)
4
5  # split dataset into batches
6  from torch.utils.data import DataLoader, TensorDataset
7
8  dataset = TensorDataset(X_tens, y_tens)
9  dataloader = DataLoader(
10      dataset,
11      batch_size=32,
12      shuffle=True
13  )
```

2. NN structure

```
1 class NeuralNetwork(nn.Module):
2
3     def __init__(self):
4         super().__init__()
5
6         self.linear1 = nn.Linear(2, 5)
7         self.sigm1 = nn.Sigmoid()
8         self.linear2 = nn.Linear(5, 5)
9         self.sigm2 = nn.Sigmoid()
10        self.linear3 = nn.Linear(5, 1)
11
12    def forward(self, x):
13        x = self.linear1(x)
14        x = self.sigm1(x)
15        x = self.linear2(x)
16        x = self.sigm2(x)
17        x = self.linear3(x)
18        return x
```

- 1 input layer, 2 hidden layers, 1 output layer
- sigmoid activation before the hidden layers

Learning loop

```
1 for i in range(1000):
2
3     for batch_X, batch_y in dataloader:
4
5         X_var = Variable(batch_X, requires_grad=
6             False).to(device)
7         y_var = Variable(batch_y, requires_grad=
8             False).to(device)
9
10        output = model(X_var)
11
12        optimizer.zero_grad()
13
14        loss = loss_func.forward(output, y_var)
15
16        loss.backward()
17
18        optimizer.step()
19
20    if i % 100 == 0:
21        print("epoch {} loss {}".format(i, loss))
```

Learning

```
1 epoch 0 loss 0.304
2 epoch 100 loss 0.060
3 epoch 200 loss 0.091
4 epoch 300 loss 0.005
5 epoch 400 loss 0.040
6 epoch 500 loss 0.022
7 epoch 600 loss 0.003
8 epoch 700 loss 0.028
9 epoch 800 loss 0.006
10 epoch 900 loss 0.013
```

Hyperopt

Hugging-
face

Initial handcrafted approach

- loss oscillated around 0.3
- looks to be biased more towards yellow class
- **were my parameters well-chosen?**

Results

WandB sweep

- equivalent to Sklearn's grid search
- orchestrated by WandB library
- independent from your ML library
 - can vary **any** parameter
- can order by a single performance metric
- these settings will lead to 48 individual training runs

Configuration

```
1  # define parameters for hyperparameter sweep
2  entity="<your account>"
3  project="mle-sweep"
4  model_file_name="separation"
5
6  sweep_config = {
7      "method": "grid", # or "random"
8      "metric": {"name": "epoch_loss", "goal": "
9                  minimize"},
10     "parameters": {
11         "num_hidden": {"values": [1, 2, 3]},
12         "hidden_dim": {"values": [2, 3, 4, 5]},
13         "learning_rate": {"values": [0.01, 0.1, 0.2,
14                                     0.5]},
15     }

WandB sweep

- put whole training instance into train()

train() function

```
1  def train(config=None):
2
3      with wandb.init(config=config):
4
5          # here you get your configuration for this instance
6          config = wandb.config
7
8          # <init model>
9          # <init loss>
10         # <init optimizer>
11         # <train>
12
13         # trained model -> upload wandb artifact
14         model_file="models/{}.pt2".format(model_file_name)
15         torch.save(model.state_dict(), model_file)
16         artifact = wandb.Artifact('model', type='model')
17         artifact.add_file(model_file)
18         wandb.log_artifact(artifact)
```

WandB sweep

- run the sweep and wait
- observe live at wandb.ai
- ... wait
- ... wait
- check the Results
- download the best-performing model

Running the sweep

```
1 sweep_id = wandb.sweep(sweep_config, project=project)
2
3 wandb.agent(sweep_id, function=train)
```

Retrieving the best model

```
1 api = wandb.Api()
2
3 sweep = api.sweep("{} / {} / {}".format(entity, project,
4 sweep_id))
5 best_run = sweep.best_run()
6
7 # download the artifacts
8 for artifact in best_run.logged_artifacts():
9     if artifact.type == "model":
10         artifact_path = artifact.download()
11         print(artifact_path)
```

face

Results?

- hidden dim = 5 neurons
- num hidden = 3 layers
- learning rate = 0.2
- duration 1 hour
 - 1 minute per instance
- now we might want to train with these parameters more carefully
 - more epochs
 - fine-tuning for accuracy / recall / precision
 - data augmentation for better fit

How parameters affect the loss?

Results after the sweep?

After automated sweep

- better separation
- less biased towards the yellow class
- **parameters were chosen methodically**

WandB

- helps to spot early problems during learning
- you don't have to mess with native GUI
 - often GUI is native not a viable option
- backs up your results (metareresults)

Results

Common Layers

- Linear (a.k.a. fully-connected)
- Convolutional (signal processing, image processing)
- Pooling (reduce dimensionality)
- Activation (Sigmoid, ReLU, Tanh)

Advanced Layers

- Recurrent (time-series processing and modelling)
- Normalization (stable training, e.g., with ReLU)
- Dropout (random neuron dropouts for regularization)
- Embedding (categorical encoding, NLP)
- Upsampling (generative models)
- Transformer (w/ Attention, TransformerEncoder, TransformerDecoder)

Optimizers

- Stochastic Gradient Descent (SGD)
- ADAM
- LBFGS — 2nd order method, small problems
- ... tens of others

Loss functions

- Mean Square Error (MSELoss)
- Absolute Mean Error (L1)
- Cross Entropy
- Binary Cross Entropy (+ With Logits)
- Cosine Similarity
- ... tens of others

Models

- models for variety all the common frameworks
- models from notable creators (Google, Meta, Microsoft, OpenAI)
- examples for running the models
- many distributed using Huggingface's own python library
- tracking of finetuned models
- notable models:
 - OpenAI's GPT
 - Google's OWL
 - Meta's Llama

Datasets

- all kinds of datasets for ML
- *common datasets*: mostly images, text, audio, tabular
- distributed using Huggingface's own python library

Spaces

- live demos of ML models
- whole "apps" to play with
- great for inspiration

google/owlv2-large-patch14

- zero-shot open vocabulary detector
 - can recognize objects it was not trained on
- will fit in *normal-ish* GPU
- similar mechanism as noted in **lecture 01**

Jupyter Notebook

The following part of the lecture is accompanied by

06_huggingface_owl.ipynb

```
import requests
from PIL import Image
import torch

from transformers import OwlV2Processor, OwlV2ForObjectDetection

processor = OwlV2Processor.from_pretrained("google/owlv2-large-patch14")
model = OwlV2ForObjectDetection.from_pretrained("google/owlv2-large-patch14")

url = "http://images.cocodataset.org/val2017/000000039769.jpg"
image = Image.open(requests.get(url, stream=True).raw)
texts = ["a photo of a cat", "a photo of a dog"]
inputs = processor(text=texts, images=image, return_tensors="pt")

with torch.no_grad():
    outputs = model(**inputs)

# Target image sizes (height, width) to rescale box predictions [batch_size, 2]
target_sizes = torch.Tensor([image.size[::-1]])
# Convert outputs (bounding boxes and class logits) to Pascal VOC Format (xmin, ymin, xmax, ymax)
results = processor.post_process_object_detection(outputs=outputs, target_sizes=target_sizes, threshold=0.9)
i = 0 # Retrieve predictions for the first image for the corresponding text query
text = texts[i]
boxes, scores, labels = results[i]["boxes"], results[i]["scores"], results[i]["labels"]
for box, score, label in zip(boxes, scores, labels):
    box = [round(i, 2) for i in box.tolist()]
    print(f"Detected {text[label]} with confidence {round(score.item(), 3)} at location {box}")
```
