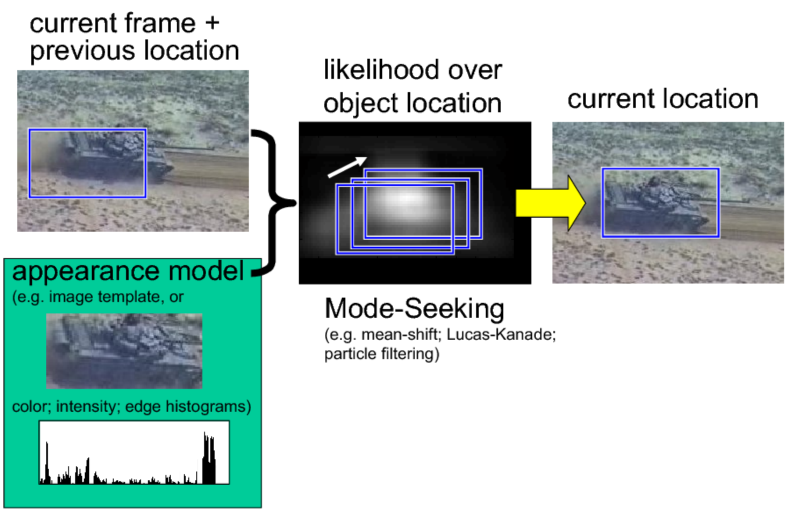
Talk Outline

- appearance based tracking
- patch similarity using histogram
- tracking by mean shift
- experiments, discussion

[1]Please note that the lecture will be accompanied be several sketches and derivations on the blackboard and few live-interactive demos in Matlab

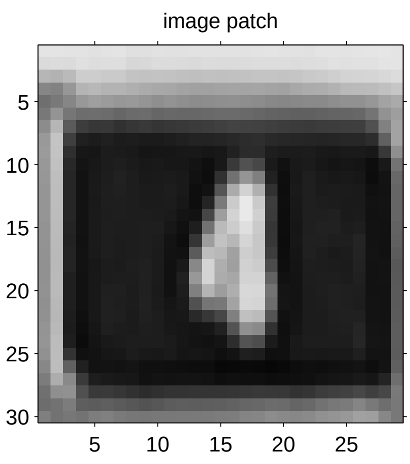
Appearance based tracking

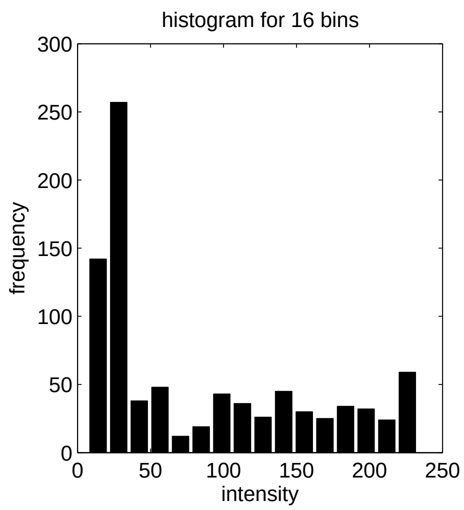


[2]

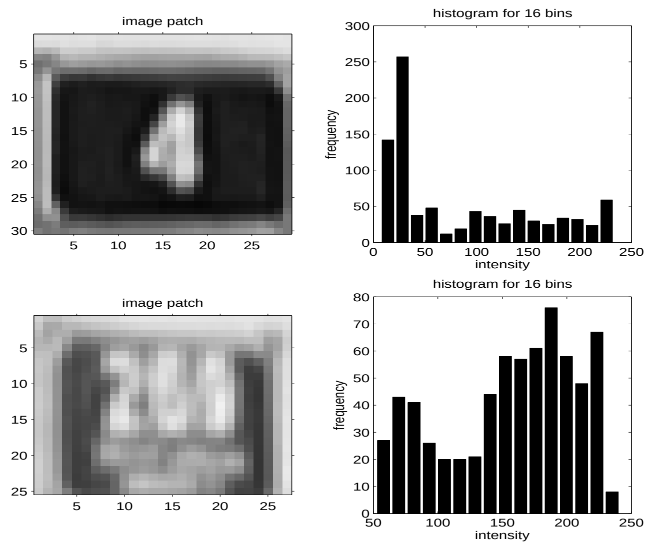
[2]illustration from [1]

Histogram based representation





Patch comparison



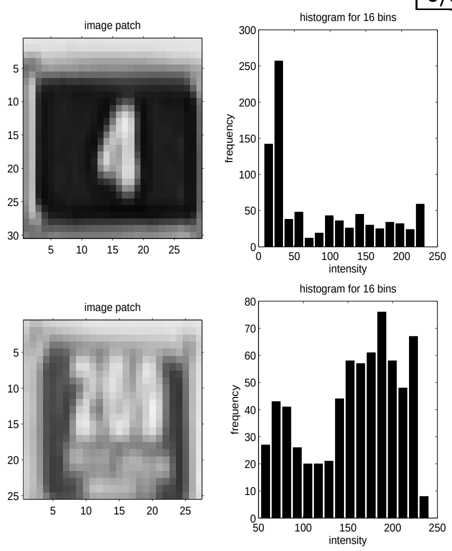
histogram difference

assume normalized histograms, i.e $\sum_{u=1}^{m} p_u = 1$

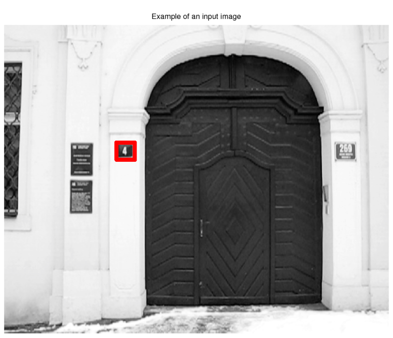
$$d = \sqrt{1 - \rho[p,q]}$$

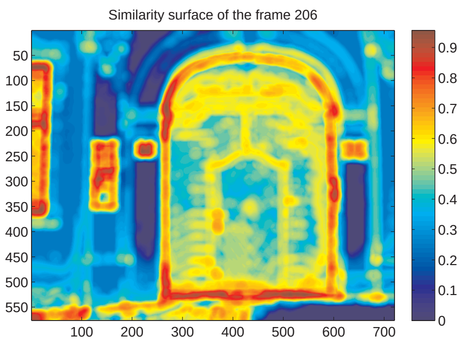
where $\rho[p,q]$ is the Bhattacharyya coefficient

$$\rho[p,q] = \sum_{u=1}^{m} \sqrt{p_u q_u}$$



Similarity measured by the Bhattacharyya coefficient



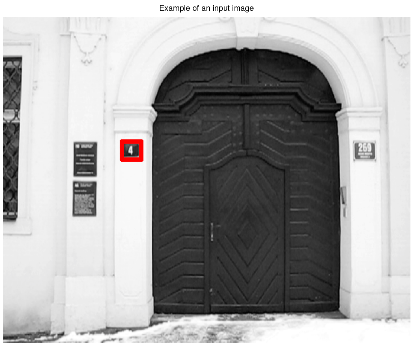


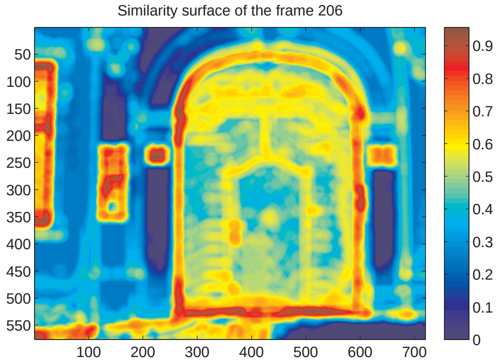
The object is the "4" plate and the model is histogram of image intensities.

$$s(\mathbf{y}) = \sum_{u=1}^{m} \sqrt{p_u(\mathbf{y}) q_u}$$

where $p(\mathbf{y})$ is the histogram of image patch at position $\mathbf{y}$ and q is the histogram of the template.

Problem: finding modes in probability density





- the complete enumeration of similarity surface can be costly,
- can we do it faster and more elegantly?

Density Gradient Estimation

Mean shift procedure

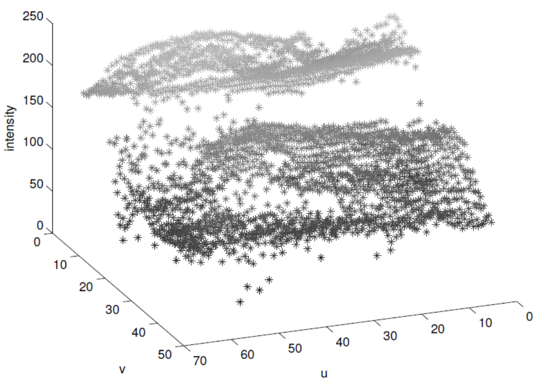
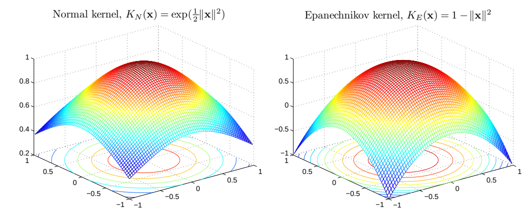
Mean shift segmentation - intensity and space

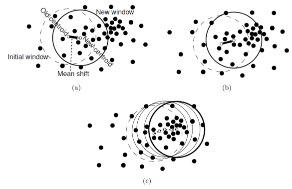


u, v are here spatial pixel coordinates

different normalization for intensity and spatial coordinates

Multivariate kernel density estimator



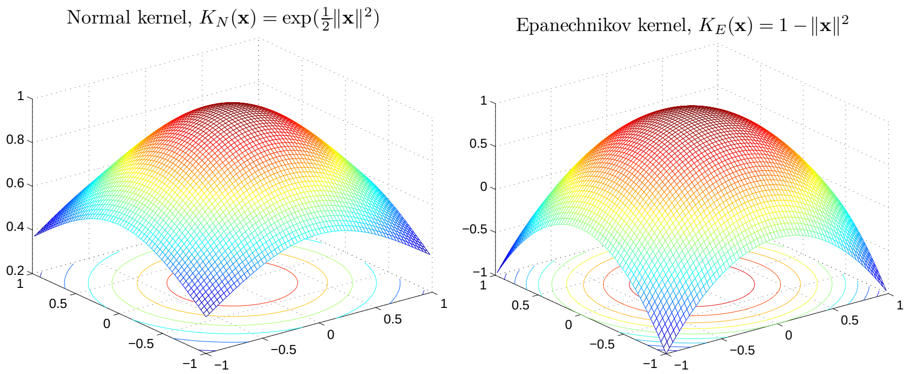


Given n data points $\mathbf{x}_i$ in d-dimensional space R^d.

$$\tilde{f}_{h,K}(\mathbf{x}) = \frac{1}{nh^d} \sum_{i=1}^{n} K\left(\frac{\mathbf{x} - \mathbf{x}_i}{h}\right)$$

- looking for extremum of $f_{h,K}(\mathbf{x})$
- gradient $\nabla f_{h,K}(\mathbf{x}) = \mathbf{0}$

Kernels

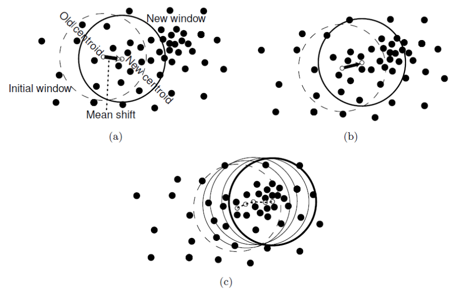


Can be seen as membership function.
Remind Kernel density estimation (Parzen method).

Remember convolution? 
[6]

[6] Taken from `http://en.wikipedia.org/wiki/Kernel_density_estimation`

Mean-shift iterations

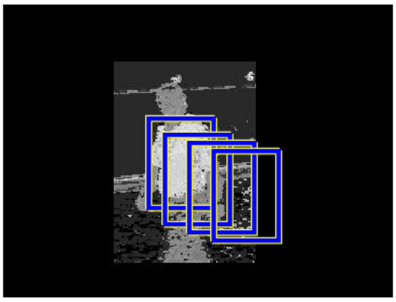


Assuming a reasonable differentiable kernel K, iterate till convergence:

$$\mathbf{y}_{k+1} = \frac{\sum_{i=1}^{n} \mathbf{x}_i g(\|\mathbf{y}_k - \mathbf{x}_i\|^2)}{\sum_{i=1}^{n} g(\|\mathbf{y}_k - \mathbf{x}_i\|^2)}$$

g is the derivative of kernel profile.

Mean-shift tracking - ratio histogram



Ratio histogram:

$$r_u = \min\left(\frac{q_u}{p_u}, 1\right)$$

where q is the histogram of the target and p is the histogram of the current frame. $w_i = r_{b(\mathbf{x}_i)}$ (just binning)

Image intensities (or colors) are tranformed into weights, w_i, by back projection of the ratio histogram. Mean-shift iterations:

$$\mathbf{y}_{k+1} = \frac{\sum_{i=1}^{n} w_i \mathbf{x}_i g(\|\mathbf{y}_k - \mathbf{x}_i\|^2)}{\sum_{i=1}^{n} w_i g(\|\mathbf{y}_k - \mathbf{x}_i\|^2)}$$

Mean-shift tracking - Bhattacharya coeficient

model, coordinates $\mathbf{x}_i^*$ centered at $\mathbf{0}$:

$$q_u = C \sum_{i=1}^{n} k(\|\mathbf{x}_i^*\|^2)\delta(b(\mathbf{x}_i^*) - u)$$

target candidate centered at $\mathbf{y}$:

$$p_u(\mathbf{y}) = C_h \sum_{i=1}^{n_h} k\left(\left\|\frac{\mathbf{y} - \mathbf{x}_i}{h}\right\|^2\right) \delta(b(\mathbf{x}_i) - u)$$

ms tracking - object and its model
