Last update: March 22, 2010

Talk Outline

- ◆ comparing patch pixels
- ◆ normalized cross-correlation, ssd . . .
- ◆ KLT - gradient based optimization
- ◆ good features to track

¹Please note that the lecture will be accompanied by several sketches and derivations on the blackboard and few live-interactive demos in Matlab

What is the problem?

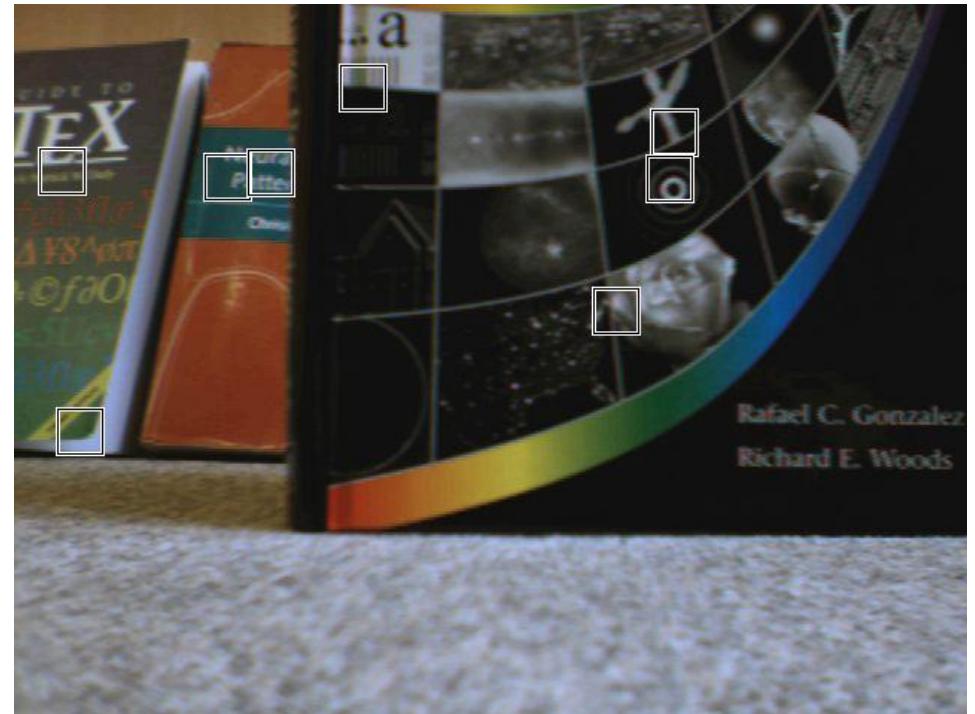

video: CTU campus, door of G building

Tracking of dense sequences — camera motion

I

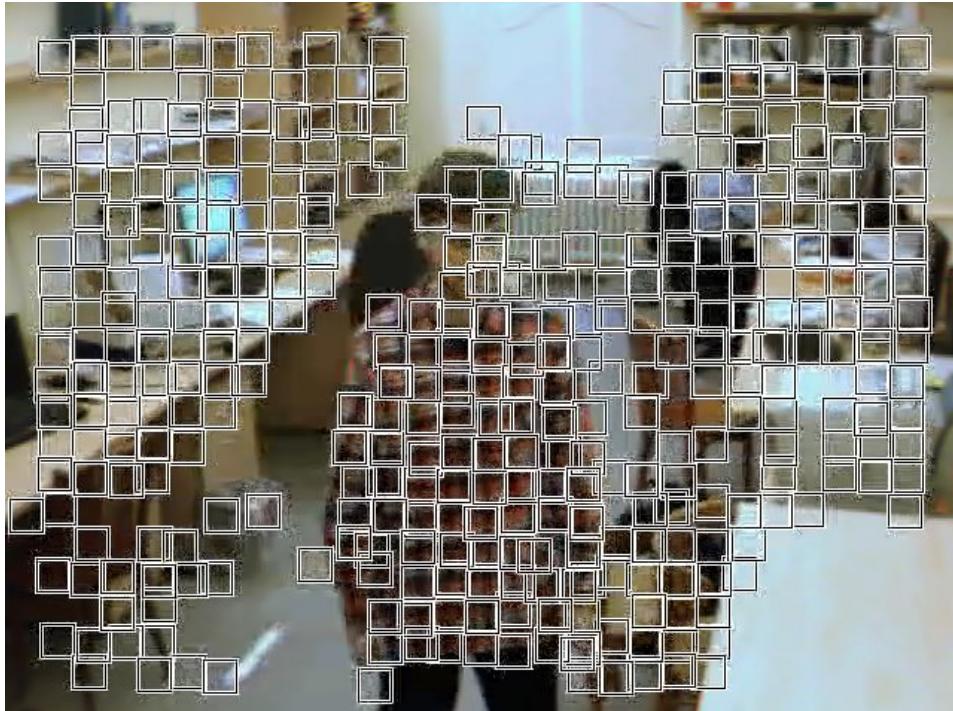

J

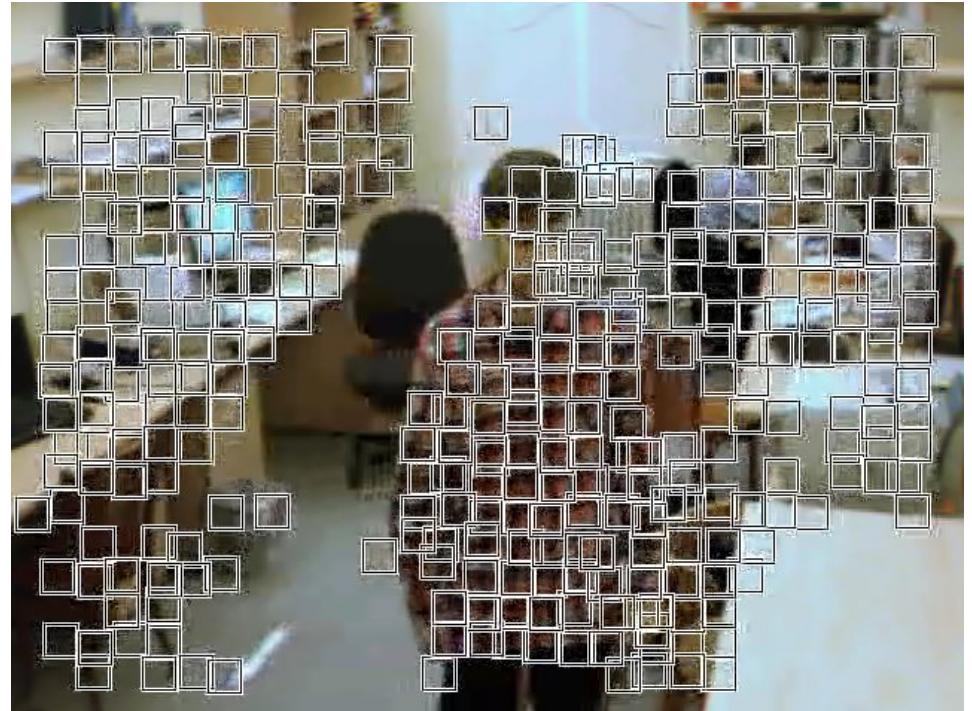

Tracking of dense sequences — object motion

I

J

Alignment of an image (patch)

Goal is to align a template image $T(\mathbf{x})$ to an input image $I(\mathbf{x})$. \mathbf{x} column vector containing image coordinates $[x, y]^\top$. The $I(\mathbf{x})$ could be also a small subwindow within an image.

How to measure the alignment?

- ◆ What is the best **criterial function**?
- ◆ How to find the **best match**, in other words how to find extremum of the criterial function?

How to measure the alignment?

- ◆ What is the best **criterial function**?
- ◆ How to find the **best match**, in other words how to find extremum of the criterial function?

Criterial function

What are the desired properties (on a certain **domain**)?

How to measure the alignment?

- ◆ discriminative
- ◆ ...

Normalized cross-correlation

You may know it as correlation coefficients

$$r_{ij} = \frac{c_{ij}}{\sqrt{c_{ii}c_{jj}}}$$

where $c_{i,j}$ are elements of the covariance matrix

Normalized cross-correlation

You may know it as correlation coefficients

$$r_{ij} = \frac{c_{ij}}{\sqrt{c_{ii}c_{jj}}}$$

where $c_{i,j}$ are elements of the covariance matrix

Having template $T(x, y)$ and image $I(x, y)$,

$$r(x, y) = \frac{\sum_k \sum_l (T(k, l) - \bar{T}) (I(x + k, y + l) - \bar{I(x, y)})}{\sqrt{\sum_k \sum_l (T(k, l) - \bar{T})^2 \sum_k \sum_l (I(x + k, y + l) - \bar{I(x, y)})^2}}$$

Normalized cross-correlation

You may know it as correlation coefficients

$$r_{ij} = \frac{c_{ij}}{\sqrt{c_{ii}c_{jj}}}$$

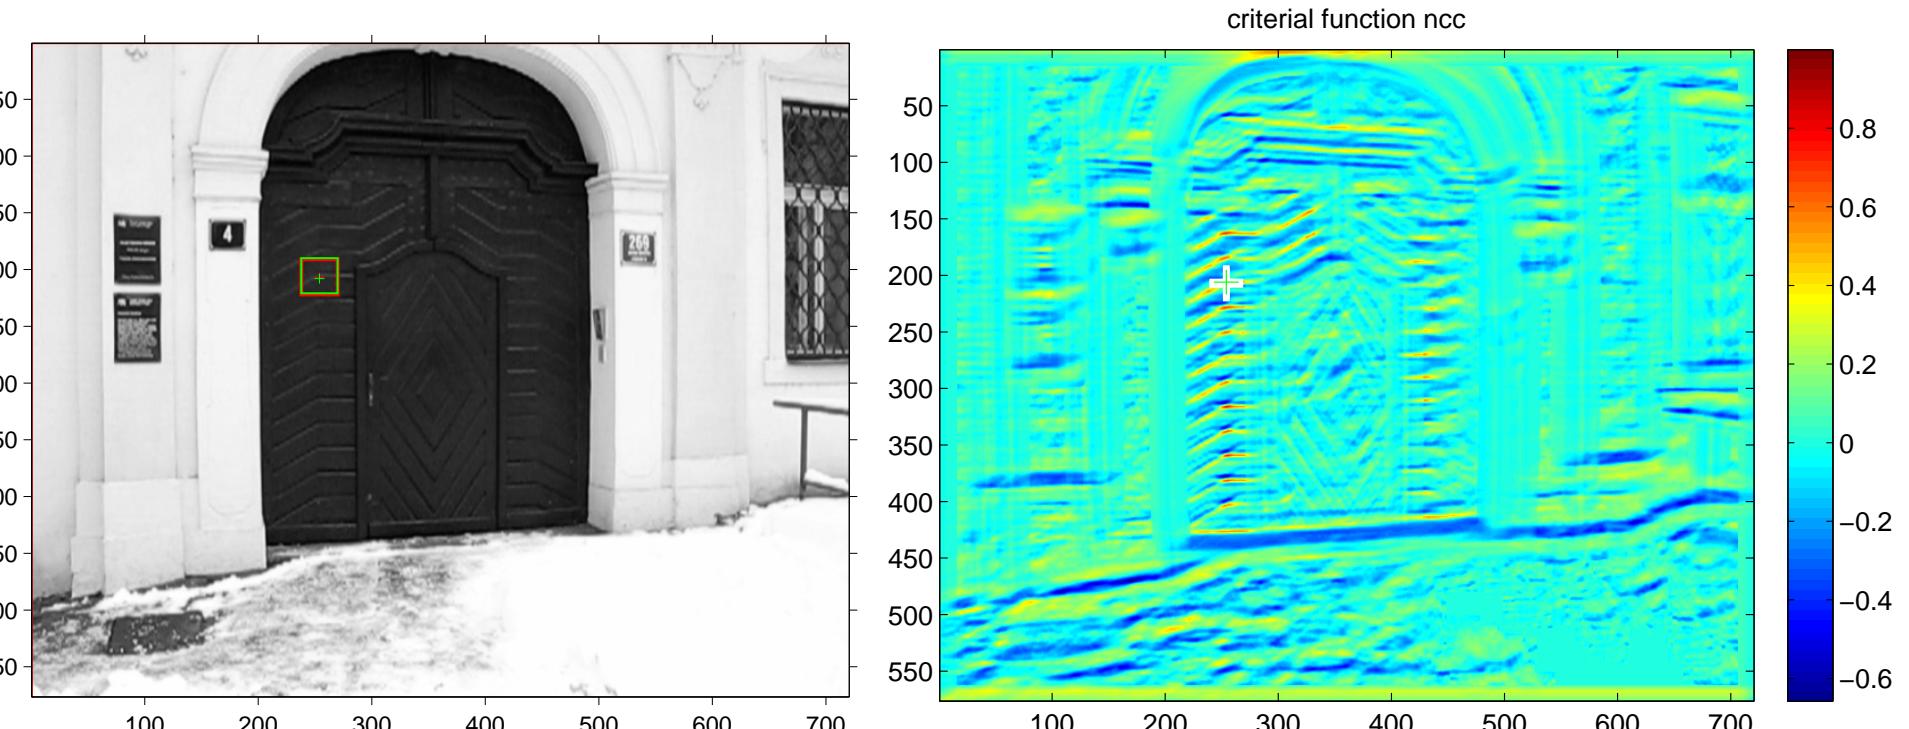

where $c_{i,j}$ are elements of the covariance matrix

Having template $T(x, y)$ and image $I(x, y)$,

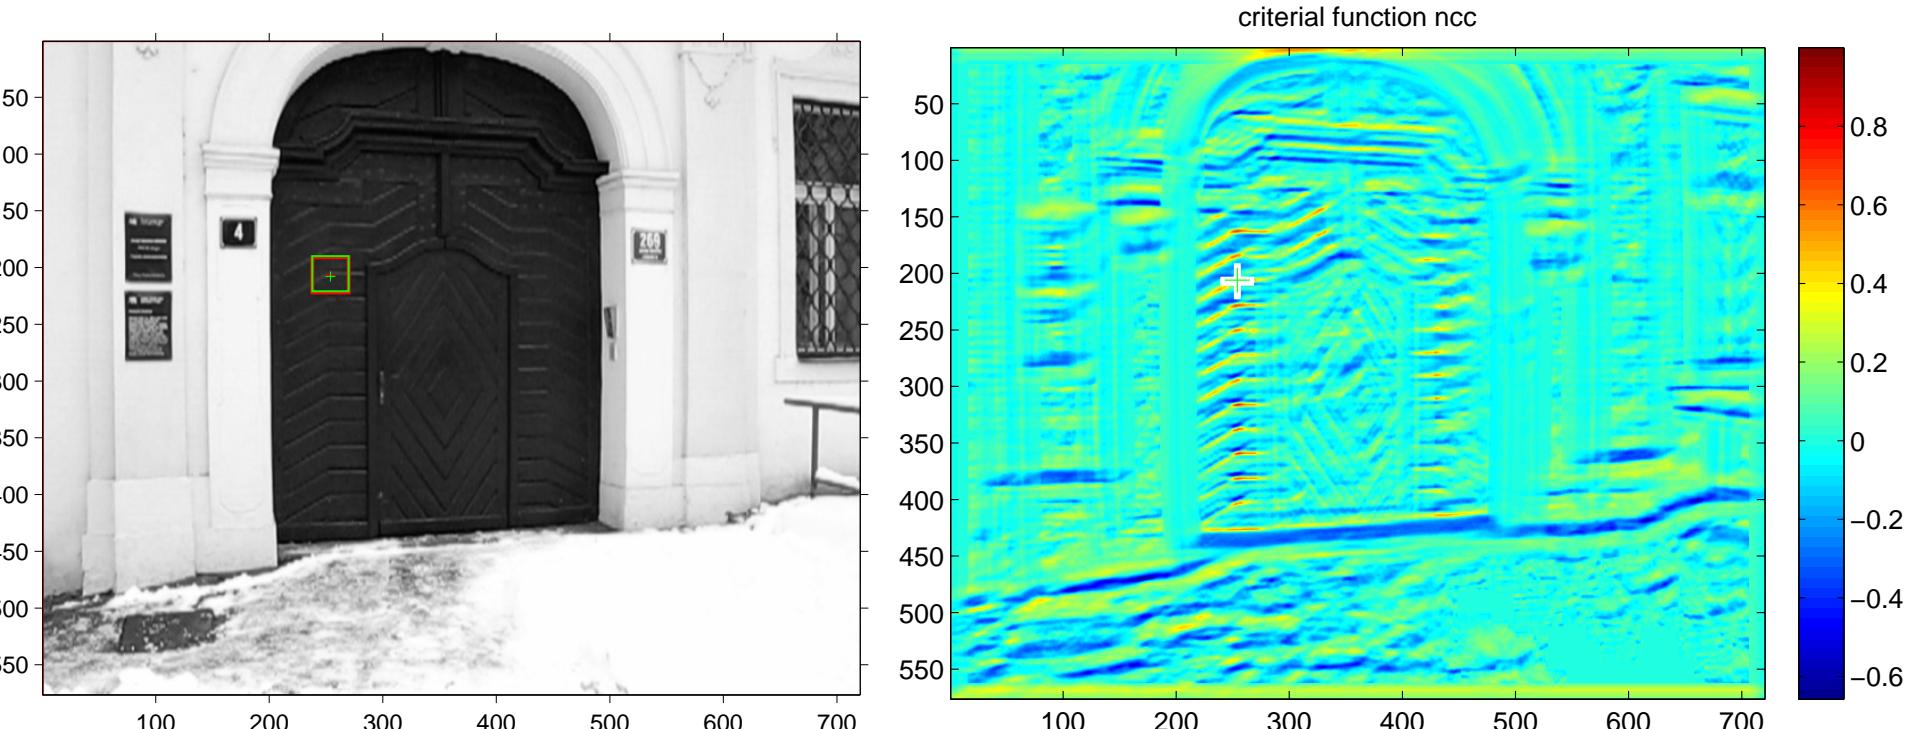

$$r(x, y) = \frac{\sum_k \sum_l (T(k, l) - \bar{T}) (I(x + k, y + l) - \bar{I(x, y)})}{\sqrt{\sum_k \sum_l (T(k, l) - \bar{T})^2 \sum_k \sum_l (I(x + k, y + l) - \bar{I(x, y)})^2}}$$

Be careful about coordinate systems (sketch on blackboard)

Normalized cross-correlation – in picture

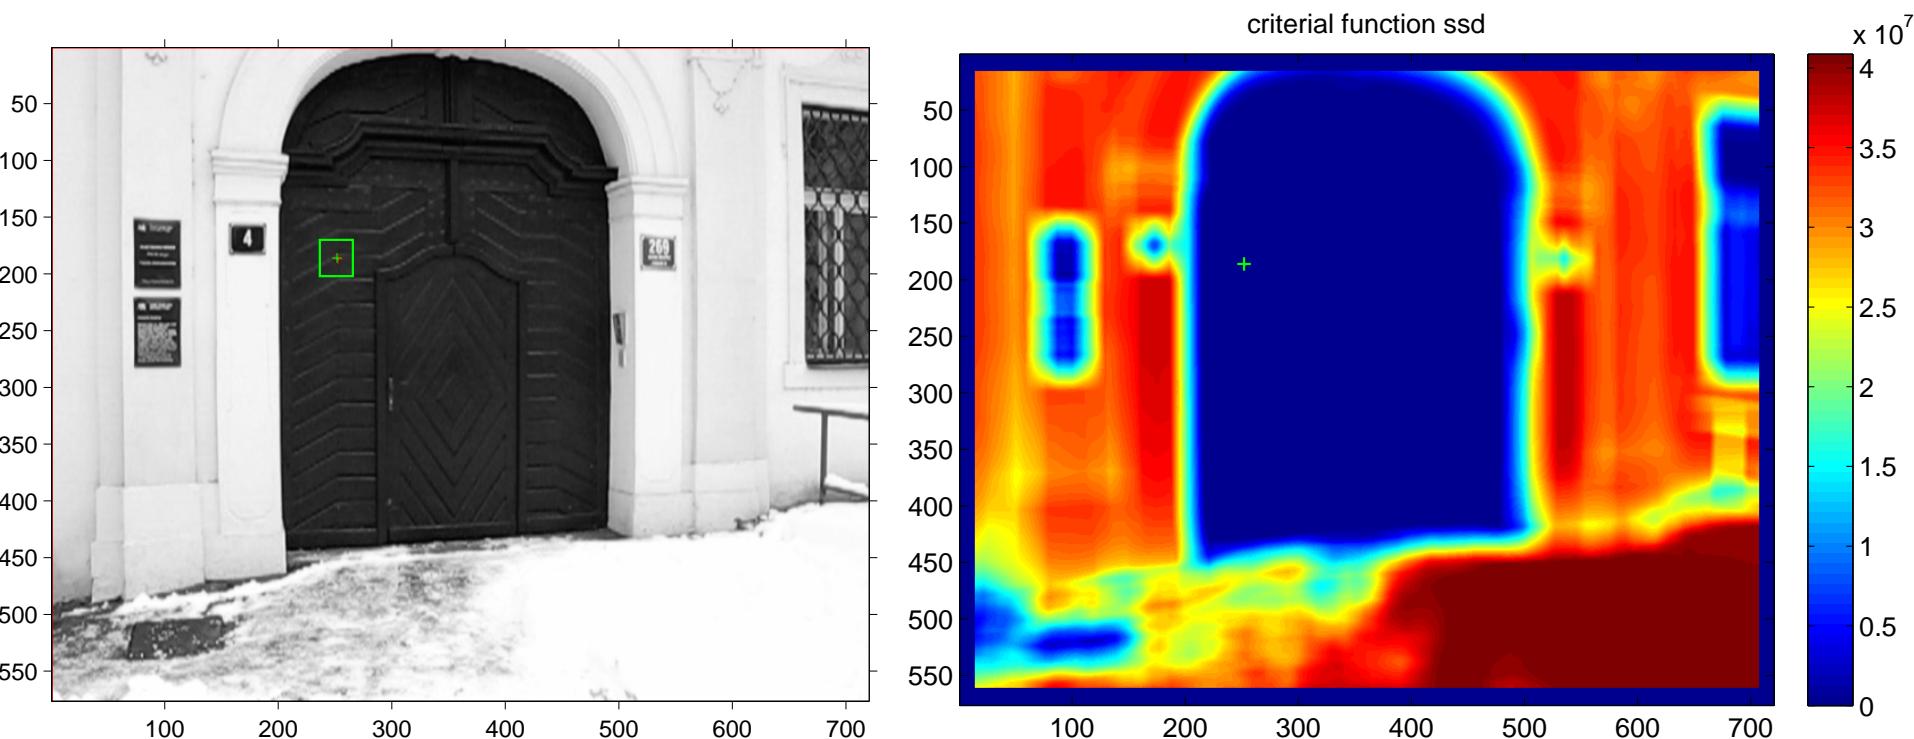

Normalized cross-correlation – in picture

- ◆ well, definitely not convex
- ◆ but the discriminability looks promising
- ◆ very efficient in computation, see [3].

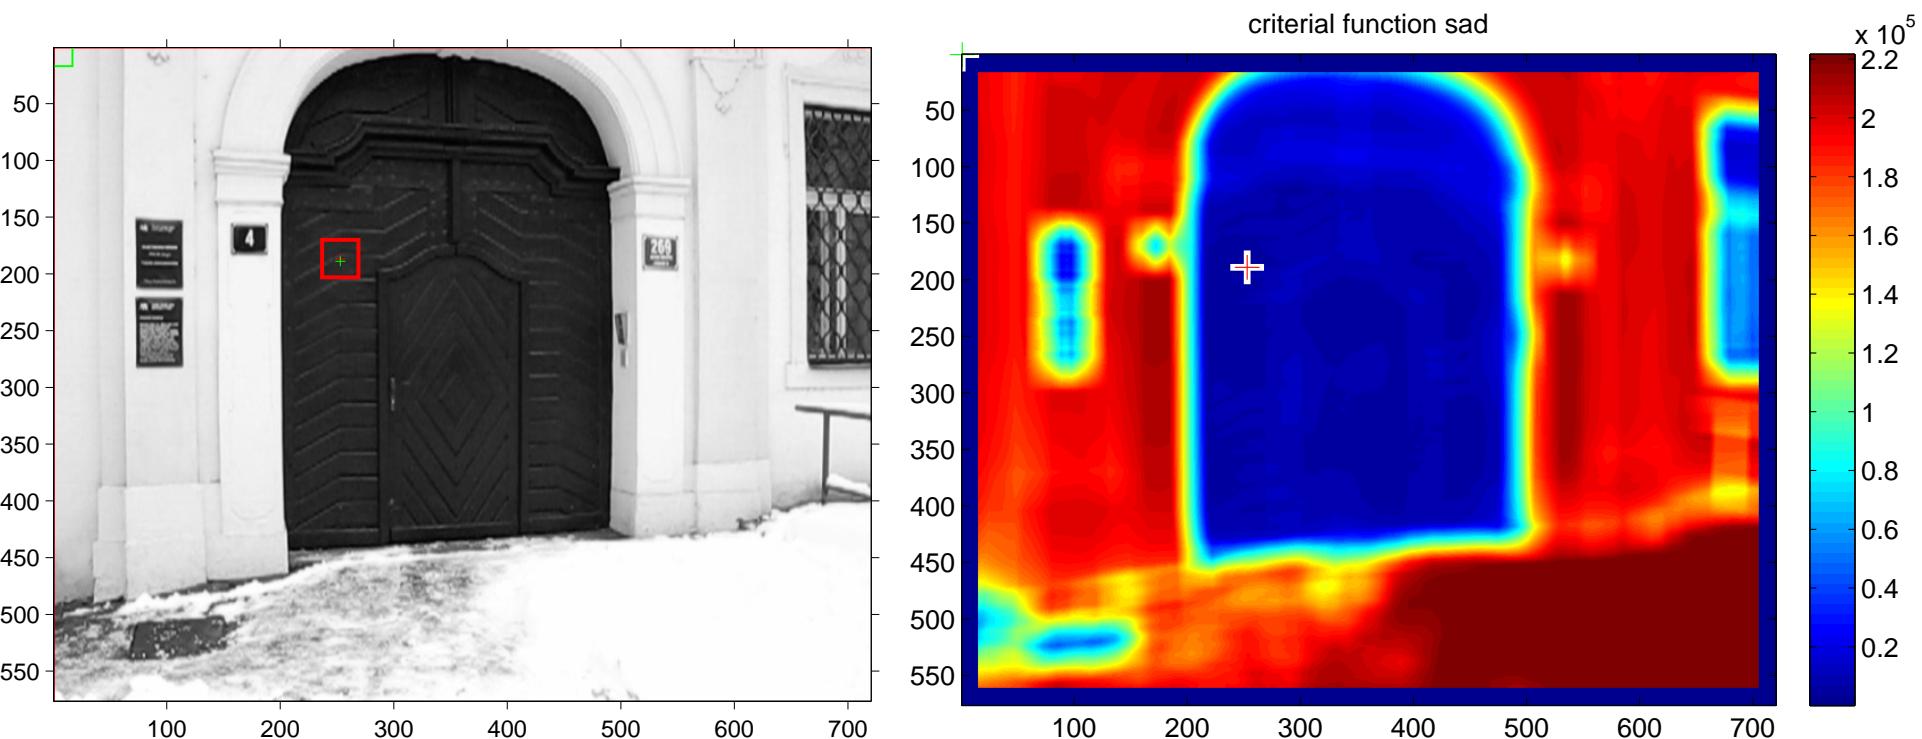

Sum of squared differences

$$ssd(x, y) = \sum_k \sum_l (T(k, l) - I(x + k, y + l))^2$$

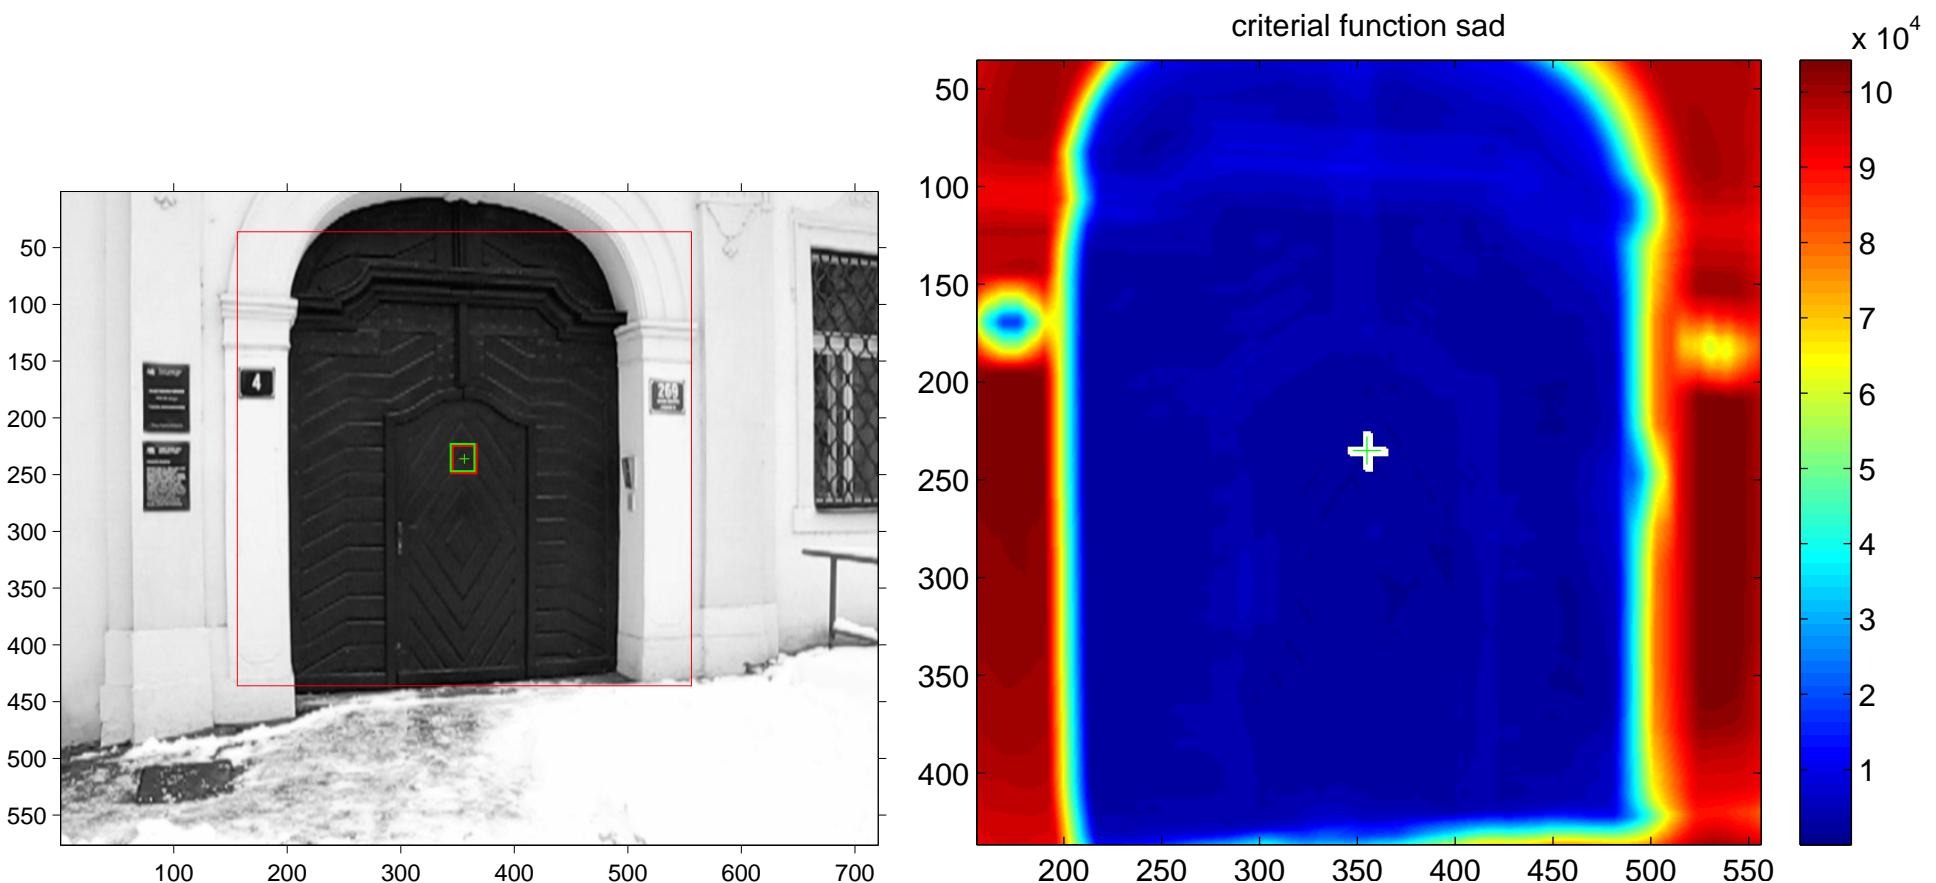

Sum of absolute differences

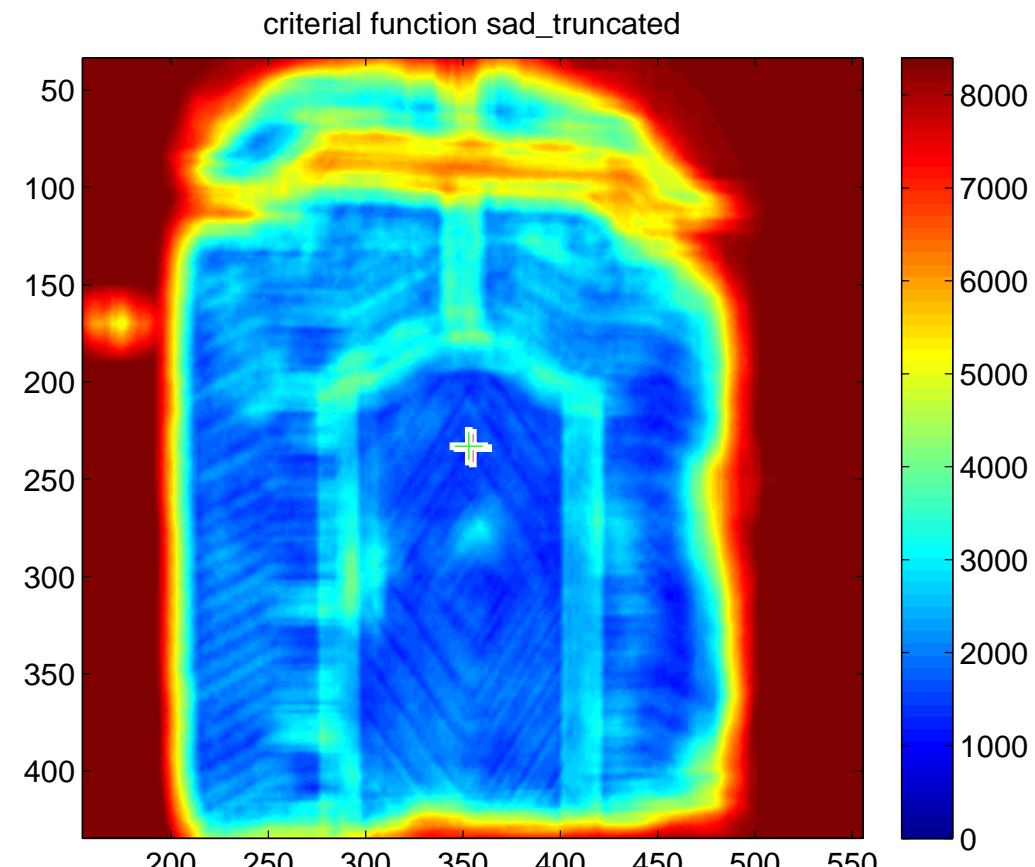

$$sad(x, y) = \sum_k \sum_l |T(k, l) - I(x + k, y + l)|$$

SAD for the door part

SAD for the door part – truncated

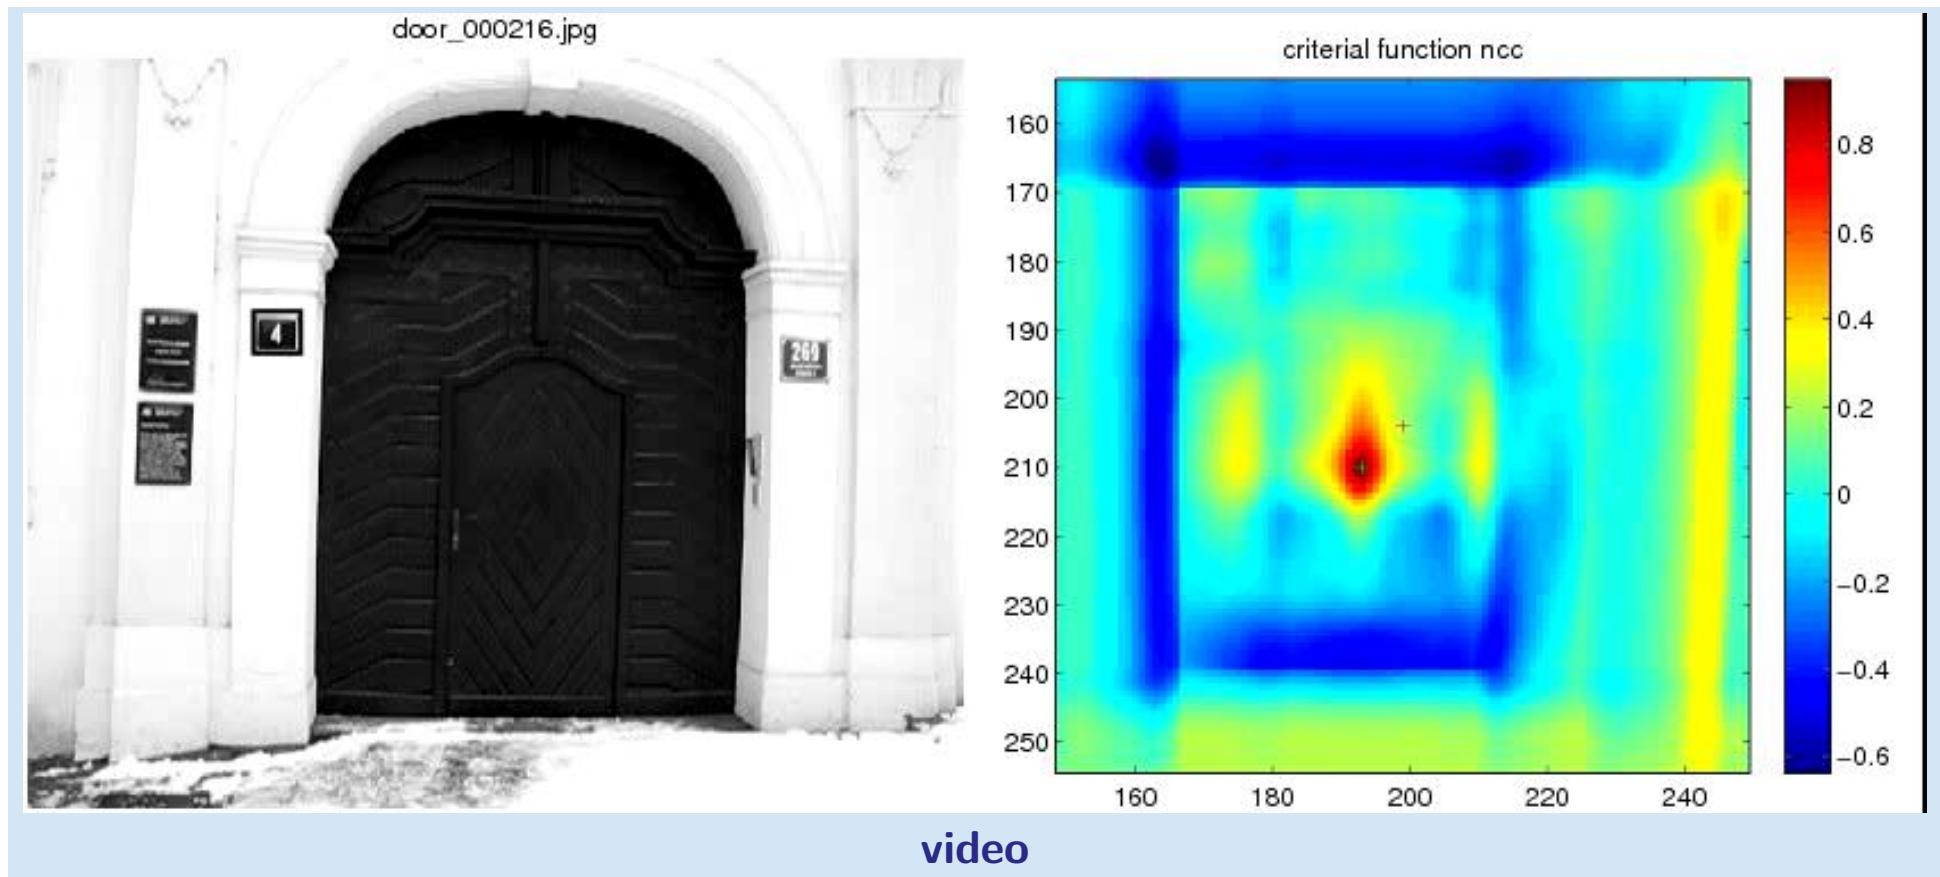

Differences greater than 20 intensity levels are counted as 20.

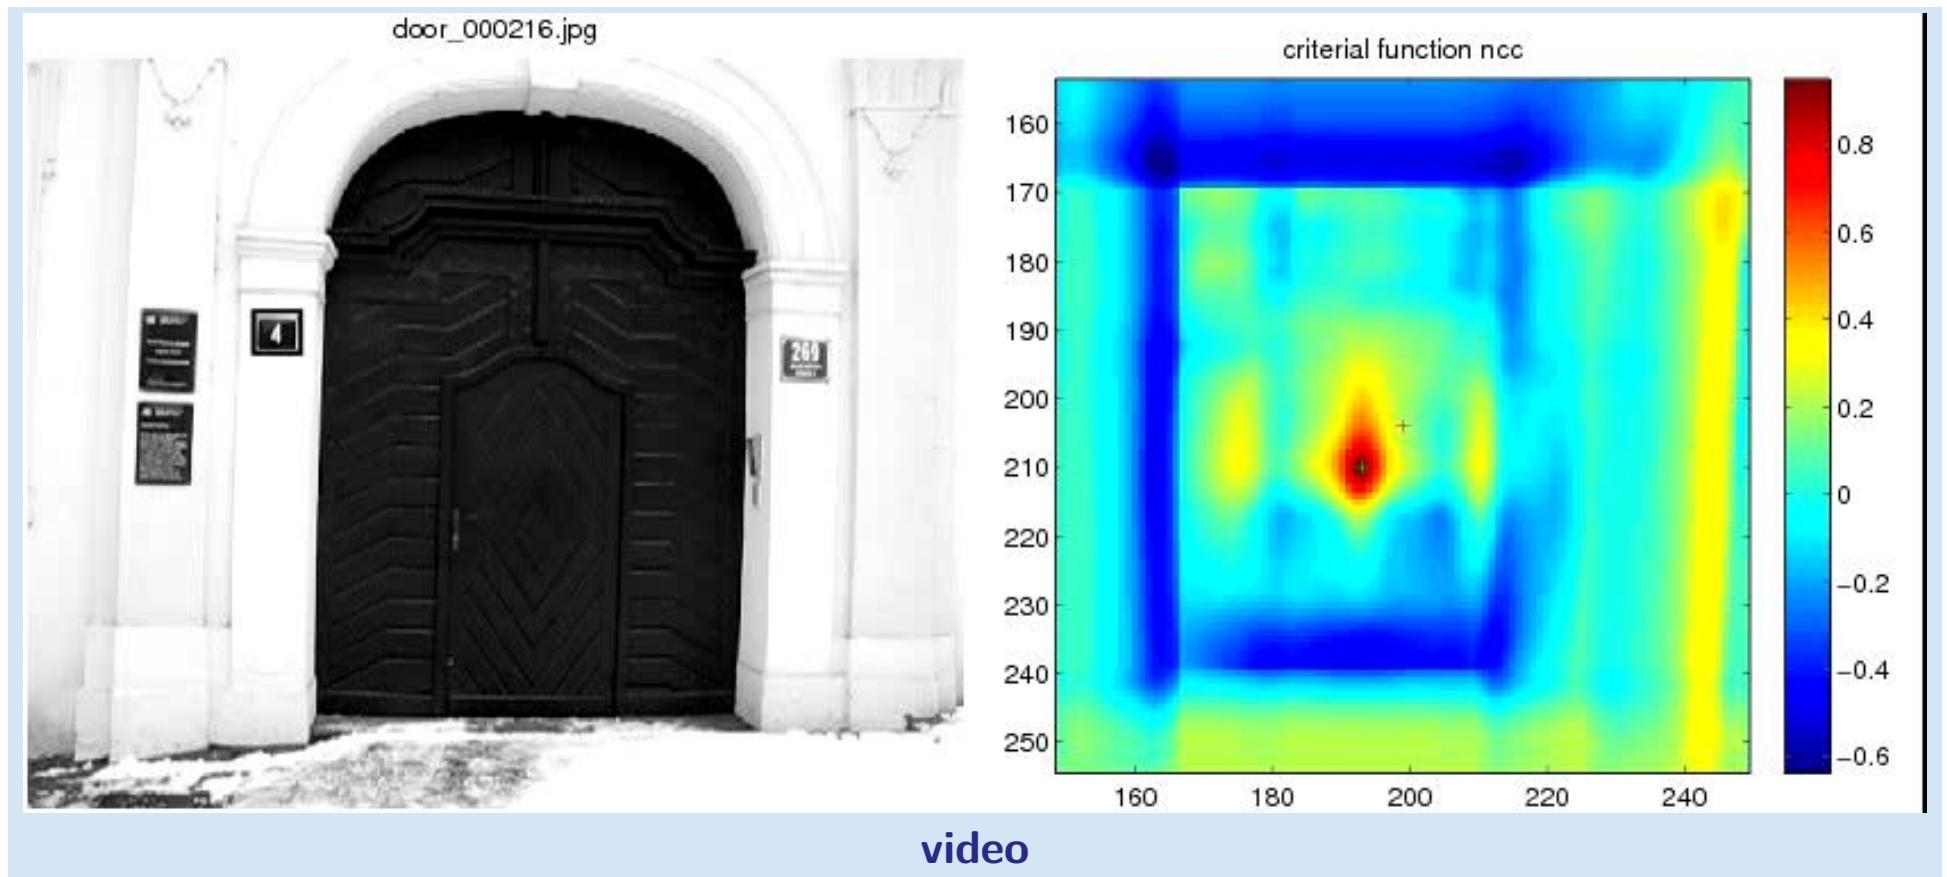

Normalized cross-correlation: how it works

live demo for various patches

Normalized cross-correlation: tracking

Normalized cross-correlation: tracking

video

- ◆ What went wrong?
- ◆ Why did it failed?

Suggestions for improvement?

Iterations? – Tracking as an optimization problem

- ◆ finding extrema of a criterial function . . .

Iterations? – Tracking as an optimization problem

- ◆ finding extrema of a criterial function . . .
- ◆ . . . sounds like an optimization problem

Kanade–Lucas–Tomasi (KLT) tracker

- ◆ Iteratively minimizes sum of square differences.
- ◆ It is a Gauss-Newton gradient descent non-linear optimization algorithm.

Importance in Computer Vision

- ◆ Firstly published in 1981 as an image registration method [4].
- ◆ Improved many times, most importantly by Carlo Tomasi [5, 6]
- ◆ Free implementation(s) available². Also part of the OpenCV library³.
- ◆ After more than two decades, a project⁴ at CMU dedicated to this single algorithm and results published in a premium journal [1].
- ◆ Part of plethora computer vision algorithms.

Our explanation follows mainly the paper [1]. It is a good reading for those who are also interested in alternative solutions.

Original Lucas-Kanade algorithm I

Goal is to align a template image $T(\mathbf{x})$ to an input image $I(\mathbf{x})$. \mathbf{x} column vector containing image coordinates $[x, y]^\top$. The $I(\mathbf{x})$ could be also a small subwindow within an image.

Set of allowable **warps** $\mathbf{W}(\mathbf{x}; \mathbf{p})$, where \mathbf{p} is a vector of parameters. For translations

$$\mathbf{W}(\mathbf{x}; \mathbf{p}) = \begin{bmatrix} x + p_1 \\ y + p_2 \end{bmatrix}$$

$\mathbf{W}(\mathbf{x}; \mathbf{p})$ can be arbitrarily complex

The best **alignment**, \mathbf{p}^* , minimizes image dissimilarity

$$\sum_{\mathbf{x}} [I(\mathbf{W}(\mathbf{x}; \mathbf{p})) - T(\mathbf{x})]^2$$

Original Lucas-Kanade algorithm II

$$\sum_{\mathbf{x}} [I(\mathbf{W}(\mathbf{x}; \mathbf{p})) - T(\mathbf{x})]^2$$

is a **nonlinear** optimization! The warp $\mathbf{W}(\mathbf{x}; \mathbf{p})$ may be linear but the pixels value are, in general, non-linear. In fact, they are essentially unrelated to \mathbf{x} .

It is assumed that some \mathbf{p} is known and best increment $\Delta\mathbf{p}$ is sought. The modified problem

$$\sum_{\mathbf{x}} [I(\mathbf{W}(\mathbf{x}; \mathbf{p} + \Delta\mathbf{p})) - T(\mathbf{x})]^2$$

is solved with respect to $\Delta\mathbf{p}$. When found then \mathbf{p} gets updated

$$\mathbf{p} \leftarrow \mathbf{p} + \Delta\mathbf{p}$$

Original Lucas-Kanade algorithm III

$$\sum_{\mathbf{x}} [I(\mathbf{W}(\mathbf{x}; \mathbf{p} + \Delta\mathbf{p})) - T(\mathbf{x})]^2$$

linearized by performing first order Taylor expansion⁵

$$\sum_{\mathbf{x}} [I(\mathbf{W}(\mathbf{x}; \mathbf{p})) + \nabla I \frac{\partial \mathbf{W}}{\partial \mathbf{p}} \Delta \mathbf{p} - T(\mathbf{x})]^2$$

$\nabla I = [\frac{\partial I}{\partial x}, \frac{\partial I}{\partial y}]$ is the **gradient** image⁶ computed at $\mathbf{W}(\mathbf{x}; \mathbf{p})$. The term $\frac{\partial \mathbf{W}}{\partial \mathbf{p}}$ is the **Jacobian** of the warp.

⁵Detailed explanation on the blackboard.

⁶As a vector it should have been a column wise oriented. However, for sake of clarity of equations row vector is exceptionally considered here.

Original Lucas-Kanade algorithm IV

Derive

$$\sum_{\mathbf{x}} [I(\mathbf{W}(\mathbf{x}; \mathbf{p})) + \nabla I \frac{\partial \mathbf{W}}{\partial \mathbf{p}} \Delta \mathbf{p} - T(\mathbf{x})]^2$$

with respect to $\Delta \mathbf{p}$

$$2 \sum_{\mathbf{x}} \left[\nabla I \frac{\partial \mathbf{W}}{\partial \mathbf{p}} \right]^\top \left[I(\mathbf{W}(\mathbf{x}; \mathbf{p})) + \nabla I \frac{\partial \mathbf{W}}{\partial \mathbf{p}} \Delta \mathbf{p} - T(\mathbf{x}) \right]$$

setting equality to zero yields

$$\Delta \mathbf{p} = \mathbf{H}^{-1} \sum_{\mathbf{x}} \left[\nabla I \frac{\partial \mathbf{W}}{\partial \mathbf{p}} \right]^\top [T(\mathbf{x}) - I(\mathbf{W}(\mathbf{x}; \mathbf{p}))]$$

where \mathbf{H} is (Gauss-Newton) approximation of **Hessian matrix**.

$$\mathbf{H} = \sum_{\mathbf{x}} \left[\nabla I \frac{\partial \mathbf{W}}{\partial \mathbf{p}} \right]^\top \left[\nabla I \frac{\partial \mathbf{W}}{\partial \mathbf{p}} \right]$$

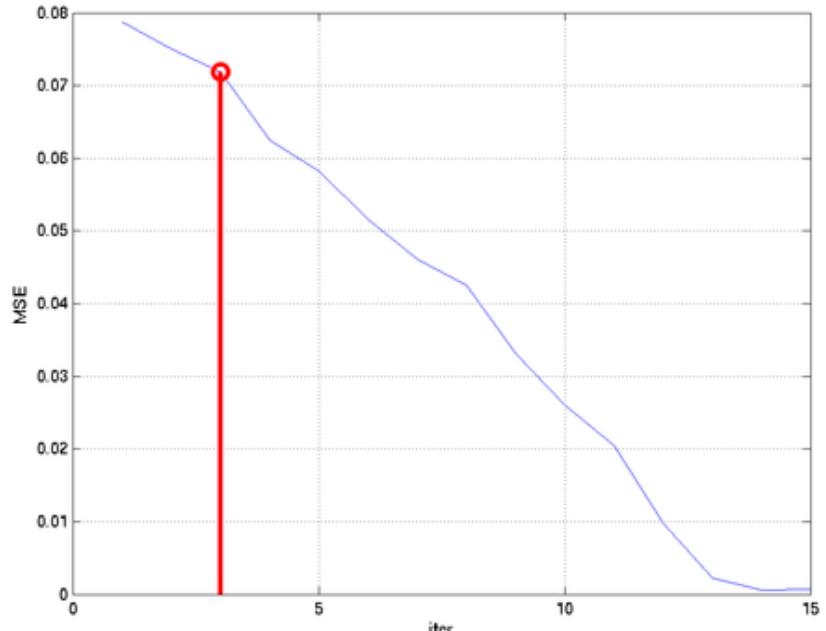

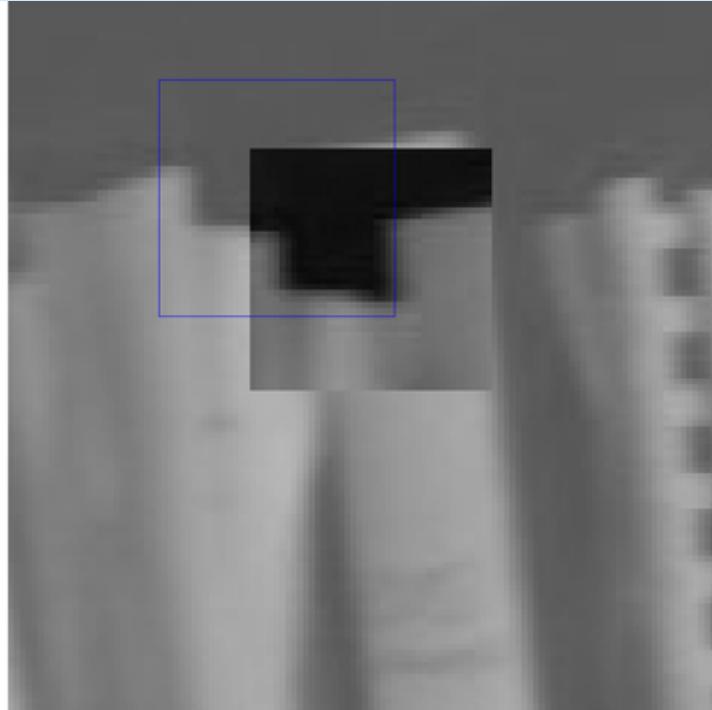

The Lucas-Kanade algorithm—Summary

Iterate:

1. Warp I with $\mathbf{W}(\mathbf{x}; \mathbf{p})$
2. Warp the gradient ∇I with $\mathbf{W}(\mathbf{x}; \mathbf{p})$
3. Evaluate the Jacobian $\frac{\partial \mathbf{W}}{\partial \mathbf{p}}$ at $(\mathbf{x}; \mathbf{p})$ and compute the steepest descent image $\nabla I \frac{\partial \mathbf{W}}{\partial \mathbf{p}}$
4. Compute the $\mathbf{H} = \sum_{\mathbf{x}} \left[\nabla I \frac{\partial \mathbf{W}}{\partial \mathbf{p}} \right]^{\top} \left[\nabla I \frac{\partial \mathbf{W}}{\partial \mathbf{p}} \right]$
5. Compute $\Delta \mathbf{p} = \mathbf{H}^{-1} \sum_{\mathbf{x}} \left[\nabla I \frac{\partial \mathbf{W}}{\partial \mathbf{p}} \right]^{\top} [T(\mathbf{x}) - I(\mathbf{W}(\mathbf{x}; \mathbf{p}))]$
6. Update the parameters $\mathbf{p} \leftarrow \mathbf{p} + \Delta \mathbf{p}$

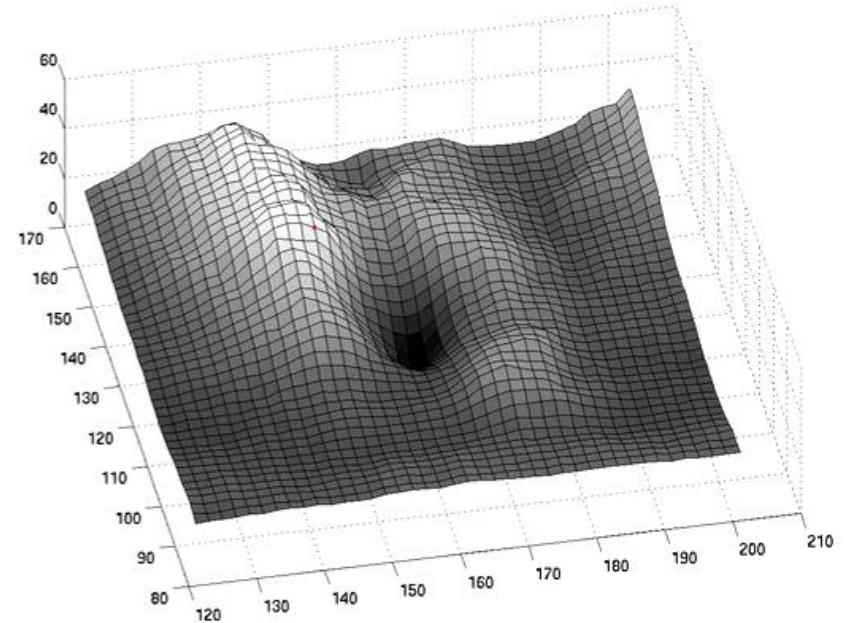

until $\|\Delta \mathbf{p}\| \leq \epsilon$

Example of convergence

Example of divergence

Divergence video: Initial state is outside the basin of attraction

Example – on-line demo

Let play and see . . .

What are good features (windows) to track?

How to select good templates $T(\mathbf{x})$ for image registration, object tracking.

$$\Delta \mathbf{p} = \mathbf{H}^{-1} \sum_{\mathbf{x}} \left[\nabla I \frac{\partial \mathbf{W}}{\partial \mathbf{p}} \right]^\top [T(\mathbf{x}) - I(\mathbf{W}(\mathbf{x}; \mathbf{p}))]$$

where \mathbf{H} is the matrix

$$\mathbf{H} = \sum_{\mathbf{x}} \left[\nabla I \frac{\partial \mathbf{W}}{\partial \mathbf{p}} \right]^\top \left[\nabla I \frac{\partial \mathbf{W}}{\partial \mathbf{p}} \right]$$

The stability of the iteration is mainly influenced by the inverse of Hessian. We can study its eigenvalues. Consequently, the criterion of a good feature window is $\min(\lambda_1, \lambda_2) > \lambda_{min}$ (texturedness).

What are good features (windows) to track?

Consider translation $\mathbf{W}(\mathbf{x}; \mathbf{p}) = \begin{bmatrix} x + p_1 \\ y + p_2 \end{bmatrix}$. The Jacobian is then

$$\frac{\partial \mathbf{W}}{\partial \mathbf{p}} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$$

$$\begin{aligned} \mathbf{H} &= \sum_{\mathbf{x}} \left[\nabla I \quad \frac{\partial \mathbf{W}}{\partial \mathbf{p}} \right]^\top \left[\nabla I \quad \frac{\partial \mathbf{W}}{\partial \mathbf{p}} \right] \\ &= \sum_{\mathbf{x}} \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \begin{bmatrix} \frac{\partial I}{\partial x} \\ \frac{\partial I}{\partial y} \end{bmatrix} \left[\frac{\partial I}{\partial x}, \frac{\partial I}{\partial x} \right] \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \\ &= \sum_{\mathbf{x}} \begin{bmatrix} \left(\frac{\partial I}{\partial x} \right)^2 & \frac{\partial I}{\partial x} \frac{\partial I}{\partial y} \\ \frac{\partial I}{\partial x} \frac{\partial I}{\partial y} & \left(\frac{\partial I}{\partial y} \right)^2 \end{bmatrix} \end{aligned}$$

The image windows with varying derivatives in both directions. Homeogeneous areas are clearly not suitable. Texture oriented mostly in one direction only would cause instability for this translation.

What are the good points for translations?

The matrix

$$H = \sum_x \begin{bmatrix} \left(\frac{\partial I}{\partial x}\right)^2 & \frac{\partial I}{\partial x} \frac{\partial I}{\partial y} \\ \frac{\partial I}{\partial x} \frac{\partial I}{\partial y} & \left(\frac{\partial I}{\partial y}\right)^2 \end{bmatrix}$$

Should have large eigenvalues. We have seen the matrix already, where?

What are the good points for translations?
