challenges in the related problems and existing approaches. The goal is not to memorize all the details and definitions!

■ Provide an overview of the existing problem formulations in

■ Multi-Goal Path Planning a.k.a. robotic Traveling Salesman

■ Challenges in planning for non-holonomic vehicle (Dubins vehicle)

specific issue related to a particular robotic application.

Given a set of cities and the distances between each pair of cities,

what is the shortest possible route that visits each city exactly once

■ The TSP can be formulated for a graph G(V, E), where V denotes

a set of locations (cities) and E represents edges connecting two

cities with the associated travel cost c (distance), i.e., for each

 $v_i, v_i \in V$ there is an edge $e_{ii} \in E$, $e_{ii} = (v_i, v_i)$ with the cost c_{ii} .

■ If the associated cost of the edge (v_i, v_i) is the Euclidean distance

It is known, the TSP is NP-hard (its decision variant) and several

 $c_{ij} = |(v_i, v_i)|$, the problem is called the **Euclidean TSP** (ETSP). In our case, $v \in V$ represents a point in \mathbb{R}^2 and solution of the ETSP

The main goal of the lecture is to make you familiar with the key

■ Inspection, exploration, and data collection missions

■ Example of problem formulations suitable for

robotic data collection planning

Traveling Salesman Problem (TSP)

Multi-Goal Path Planning Dubins Planning Data Collection Planning Mobile Robotic Exploration (TSP-based)

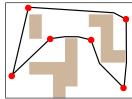

Multi-Goal Path Planning

Motivation

Having a set of locations (goals) to be visited, determine the cost efficient path to visit them and return to a starting location.

- Locations where a robotic arm performs some task
- Locations where a mobile robot has to be navigated To perform measurements such as scan the environment or

Problem Berlin52 from the **TSPLIB**

Beside the heuristic and approximations algorithms (such as Christofides 3/2-approximation algorithm), other (..soft-computing") approaches have been proposed, e.g., based on genetic algorithms, and memetic approaches, ant colony optimization (ACO), and neural networks.

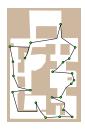

A4M36PAH - Lecture 10: Multi-Goal Planning

A4M36PAH - Lecture 10: Multi-Goal Planning

Multi-Goal Path Planning (MTP) Problem

Given a map of the environment W, mobile robot R, and a set of locations, what is the shortest possible collision free path that visits each location exactly once and returns to the origin location.

- MTP problem is de facto the TSP with the cost associated to the edges as the length of the shortest path connecting the locations
- For *n* locations, we need to compute up to n^2 shortest paths (solve n^2 motion planning problems)
- The paths can be found as the shortest path in a graph (roadmap), from which the G(V, E)for the TSP can be constructed

Visibility graph as the roadmap for a point robot provides a straight forward solution but such a shortest path may not be necessarily feasible for more complex robots

Multi-Goal Path Planning in Robotic Missions

Multi-goal path planning

- It builds on a simple path and trajectory planning
- It is a combinatorial optimization problem to determine the sequence to visit the given locations
- It allows to solve (or improve performance of) more complex prob-
 - Inspection planning Find the shortest tour to see (inspect) the
 - Data collection planning Determine a cost efficient path to collect data from the sensor stations (locations)
 - Robotic exploration Create a map of unknown environment as quickly as possible

Inspection Planning

Motivations (examples)

- Periodically visit particular locations of the environment to check, e.g., for intruders, and return to the starting locations
- Based on available plans, provide a guideline how to search a building to find possible victims as quickly as possible (search and rescue scenario)

A4M36PAH - Lecture 10: Multi-Goal Planning

- Lecture 10: Multi-Goal Plannin

A solution of the Art Gallery Problem

- 2. Create a roadmap connecting the sensing location E.g., using visibility graph or randomized sampling based approaches
- 3. Find the inspection path visiting all the sensing locations as a solution of the multi-goal path planning

De facto solution of the TSP

Inspection planning is also called coverage path planning in literature.

Example – Inspection Planning with AUV

■ Determine shortest inspection path for Autonomous Underwater Vehicle (AUV) to inspect a propeller of the vessel

Self-Organizing Maps based Solution of the TSP

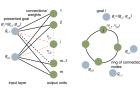

Kohonen's type of unsupervised two-layered neural network

- Neurons' weights represent nodes $\mathcal{N} = \{\nu_1, \dots, \nu_m\}$) in a plane.
- Nodes are organized into a ring.
- Sensing locations $S = \{s_1, \dots s_n\}$ are presented to the network in a random order.
- Nodes compete to be winner according to their distance to the presented goal s

$$\nu^* = \operatorname{argmin}_{\nu \in \mathcal{N}} |\mathcal{D}(\nu, s)|$$

■ The winner and its neighbouring nodes are adapted (moved) towards the city according to the neighbouring function

$$F(\sigma, d) = \left\{ egin{array}{ll} e^{-rac{d^2}{\sigma^2}} & ext{for } d < m/n_f \\ 0 & ext{otherwise,} \end{array}
ight.$$

- Best matching unit ν to the presented prototype s is determined according to distance function $|\mathcal{D}(\nu, s)|$
- For the Euclidean TSP, \mathcal{D} is the Euclidean
- However, for problems with obstacles, the multi-goal path planning, $\mathcal D$ should correspond to the length of the shortest, colli-

Multi-Goal Path Planning with Goal Areas

■ It may be sufficient to visit a goal region instead of the particular point location

Multi-Goal Path Planning Dubins Planning Data Collection Planning Mobile Robotic Exploration (TSP-based)

E.g., to take a sample measurement at each goal

Not only a sequence of goals visit has to be determined, but also an appropriate sensing location for each goal need to be found.

A4M36PAH - Lecture 10: Multi-Goal Planning

The problem with goal regions can be considered as a variant of the Traveling Salesman Problem with Neighborhoods (TSPN).

Traveling Salesman Problem with Neighborhoods

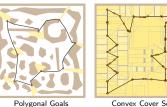

Given a set of n regions (neighbourhoods), what is the shortest closed path that visits each region.

■ The problem is NP-hard and APX-hard, it cannot be approximated to within factor $2 - \epsilon$, where $\epsilon > 0$

Safra and Schwartz (2006) - Computational Complexity

- Approximate algorithms exists for particular problem variants E.g., Disjoint unit disk neighbourhoods
- Flexibility of SOM for the TSP allows to generalize the unsupervised learning procedure to address the TSPN
- TSPN provides a suitable problem formulation for planning various inspection and data collection missions

SOM-based Solution of the Traveling Salesman Problem with Neighborhoods (TSPN)

Multi-Goal Path Planning Dubins Planning Data Collection Planning Mobile Robotic Exploration (TSP-based)

Multi-Goal Path Planning Dubins Planning Data Collection Planning Mobile Robotic Exploration (TSP-based)

Problem Statement - MGMP Problem

- The working environment $\mathcal{W} \subset \mathbb{R}^3$ is represented as a set of obstacles $\mathcal{O} \subset \mathcal{W}$ and the robot configuration space \mathcal{C} describes all possible configurations of the robot in \mathcal{W}
- For $q \in \mathcal{C}$, the robot body $\mathcal{A}(q)$ at q is collision free if $\mathcal{A}(q) \cap \mathcal{O} = \emptyset$ and all collision free configurations are denoted as C_{free}
- Set of *n* goal locations is $\mathcal{G} = (g_1, \dots, g_n)$, $g_i \in \mathcal{C}_{free}$
- lacktriangle Collision free path from q_{start} to q_{goal} is $\kappa:[0,1] o \mathcal{C}_{free}$ with $\kappa(0) = q_{start}$ and $d(\kappa(1), q_{end}) < \epsilon$, for an admissible distance ϵ
- Multi-goal path τ is admissible if $\tau:[0,1]\to \mathcal{C}_{free},\ \tau(0)=\tau(1)$ and there are n points such that $0 \le t_1 \le t_2 \le \ldots \le t_n$, $d(\tau(t_i), v_i) < \epsilon$, and $\bigcup_{1 < i < n} v_i = \mathcal{G}$
- The problem is to find path τ^* for a cost function c such that $c(\tau^*) = \min\{c(\tau) \mid \tau \text{ is admissible multi-goal path}\}\$

MGMP – Examples of Solutions

- We aim to avoid explicit determination of all paths connecting two locations $g_i, g_i \in \mathcal{G}$
- Various approaches can be found in literature, e.g.,
 - Considering Euclidean distance as approximation in solution of the TSP as the Minimum Spanning Tree (MST)

Saha et al. (2006), IJJR

■ Steering RRG roadmap expansion by unsupervised learning of SOM for the TSP

Multi-Goal Path Planning Dubins Planning Data Collection Planning

A4M36PAH - Lecture 10: Multi-Goal Planning Multi-Goal Path Planning Dubins Planning Data Collection Planning Mobile Robotic Exploration (TSP-based)

Dubins Planning Data Collection Planning Mobile Robotic Exploration (TSP-based)

Optimal Maneuvers for Dubins Vehicle

- For two states $q_1 \in SE(2)$ and $q_2 \in SE(2)$ in the environment without obstacles $\mathcal{W} = \mathbb{R}^2$ the optimal paths can be characterized as one of two main types
 - CCC type: LRL, RLR;
 - CSC type: RLR, LSL, LSR, RSL, RSR;

where S - straight line arc, C - circular arc oriented to left (L) or right (R) L. E. Dubins (1957) - American Journal of Mathematics

- The optimal paths are called **Dubins maneuvers**:
 - Constant velocity: v(t) = v and turning radius ρ
 - **6** types of trajectories connecting any configuration in $\mathbb{R}^2 \times \mathbb{S}^1$

■ The control *u* is according to *C* and *S* type one of the three possible values $u \in \{-1, 0, 1\}$

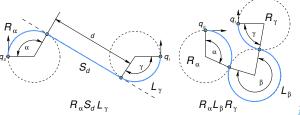

Parametrization of Dubins Maneuvers

Parametrization of each trajectory phase:

$$\{L_{\alpha}R_{\beta}L_{\gamma},R_{\alpha}L_{\beta}R_{\gamma},L_{\alpha}S_{d}L_{\gamma},L_{\alpha}S_{d}R_{\gamma},R_{\alpha}S_{d}L_{\gamma},R_{\alpha}S_{d}R_{\gamma}\}$$

for $\alpha \in [0, 2\pi)$, $\beta \in (\pi, 2\pi)$, $d \ge 0$

Notice the prescribed orientation at go and go

Planning with Dubins vehicle

■ The optimal path connecting two configurations can be found analytically

E.g., for UAVs that usually operates in environment without obstacles

- The Dubins maneuvers can be used in randomized-sampling based motion planners, such as RRT, in the control based sampling
- We can consider the model of Dubins vehicle in the multi-goal path planning
 - Surveillance, inspection or monitoring missions to periodically visits given target locations (areas)
- Dubins Traveling Salesman Problem DTSP

Given a set of locations, what is the shortest Dubins path that visits each location exactly once and returns to the origin location.

A4M36PAH - Lecture 10: Multi-Goal Planning

■ Therefore, we can generalize the MTP to multi-goal motion plan-

ning (MGMP) considering motion (trajectory) planners in C-space.

sional configuration space (C-space) can be a challenging problem

"simple" collision free (shortest) paths in the polygonal domain

Constant forward velocity

Multi-Goal Motion Planning

■ An example of MGMP can be Plan a cost efficient trajectory for hexapod walking robot to visit a

set of target locations.

- Limited minimal turning radius ρ
- Vehicle state is represented by a triplet $q = (x, y, \theta)$, where
- $(x,y) \in \mathbb{R}^2$, $\theta \in \mathbb{S}^2$ and thus, $q \in SE(2)$

The vehicle motion can be described by the equation:

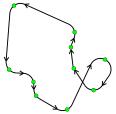

$$\left[\begin{array}{c} \dot{x} \\ \dot{y} \\ \dot{\theta} \end{array}\right] = v \left[\begin{array}{c} \cos \theta \\ \sin \theta \\ \underline{u} \end{array}\right], \quad |u| \leq 1,$$

where u is the control input.

Dubins Traveling Salesman Problem (DTSP)

■ Let have Dubins vehicle with minimal turning

- Let the given set of *n* target locations be $G = \{g_1, \ldots, g_n\}$
- Let $\Sigma = (\sigma_1, \dots, \sigma_n)$ be a permutation of $\{1, \ldots, n\}$
- Let \mathcal{P} be projection form SE(2) to \mathbb{R}^2 such that $\mathcal{P}(q_i) = (x_i, y_i), q_i \in SE(2)$ and $g_i = (x_i, y_i)$

■ DTSP is a problem to determine the minimum length tour that visits every location $g_i \in G$ while satisfying motion constraints of the Dubins vehicle

A similar graph as for DTP can be used for heading intervals

■ The ratio between the lower bound and feasible solution of the

■ It can be used to inform how to splitting heading intervals

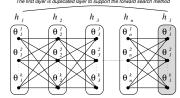

The DIP-based Sampling of Headings in the DTP

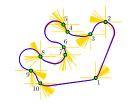

■ The solution of the DIP is a lower bound of the DTP

DTP provides estimation of the solution quality

DTSP as a Solution of the DTP

Multi-Goal Path Planning Dubins Planning Data Collection Planning

- Better solution of the DTP can be found for more samples
- Better solution of the DTP will also improve the DTSP, but only for the given sequence

Two questions arise for a practical solution of the DTP

■ How to sample the headings? Since more samples makes finding solution more demanding

We need to sample the headings in a "smart" way.

DTSP - Optimization Criterion

 \blacksquare DTSP is an optimization problem over all permutations Σ and headings $\Theta = \{\theta_{\sigma_1}, \dots, \theta_{\sigma_n}\}$ for the states $(q_{\sigma_1}, \dots, q_{\sigma_n})$ such that $q_{\sigma_i} = (g_{\sigma_i}, \theta_{\sigma_i})$

$$minimize_{\Sigma,\Theta} \qquad \sum_{i=1}^{n-1} \mathcal{L}(q_{\sigma_i}, q_{\sigma_{i+1}}) + \mathcal{L}(q_{\sigma_n}, q_{\sigma_1}) \qquad (1)$$

subject to
$$q_i = (g_i, \theta_i) \ i = 1, \dots, n$$
 (2)

L $(q_{\sigma_i}, q_{\sigma_i})$ is the length of the shortest possible Dubins maneuver connecting the states q_{σ_i} and q_{σ_i} .

Alternating Algorithm (AA) provides a solution of the DTSP for

Multi-Goal Path Planning Dubins Planning Data Collection Planning Mobile Robotic Exploration (TSP-based

If the sequence of the visits Σ to the target locations is given

Challenges of the Dubins Traveling Salesman Problem ■ The key difficulty of the DTSP is that the path length mutually

Order of the visits to the locations

■ Headings at the target locations

■ the problem is to determine the optimal heading at each location

DTSP with the Given Sequence of the Visits to the Targets

■ We call the problem as the Dubins Touring Problem (DTP)

Váňa and Faigl (2016)

- Let for each location $g_i \in G$ sample possible heading to k values, i.e., for each g_i the set of headings be $h_i = \{\theta_1^1, \dots, \theta_1^k\}$.
- lacksquare Since Σ is given, we can construct a graph connecting two consecutive locations in the sequence by all possible headings
- For such a graph and particular headings $\{h_1, \ldots, h_n\}$, we can find an optimal headings and thus, the optimal solution of the DTP.

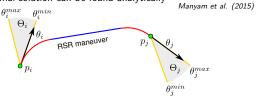

Dubins Interval Problem

■ Dubins Interval Problem (DIP) is a generalization of Dubins maneuvers to the shortest path connecting two points p_i and p_i

AA is heuristic algorithm which solutions can be bounded by

 $L_{TSP}\kappa \lceil n/2 \rceil \pi \rho$, where L_{TSP} is the length of the optimal so-

- In the DIP, an leaving interval Θ_i at p_i and arrival interval Θ_i at p_i are allowed
- The optimal solution can be found analytically

- Solution of the DIP is a tight lower bound for the DTP
- Solution of the DIP is not a feasible solution of the DTP Notice, for $\Theta_i = \Theta_i = \langle 0, 2\pi \rangle$ the optimal maneuver for DIP is straight

00 1.1000-Anality 1.0010-1.0001 Computational time [s]

Váňa and Faigl (2016)

line segment

DTSP - Sampling-based Approach

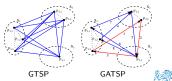

■ Sampled heading values can be directly utilized to find the sequence as a solution of the Generalized Traveling Salesman Problem (GTSP)

all specified subsets of the graph's vertices.

consists just a single vertex

■ GATSP → ATSP

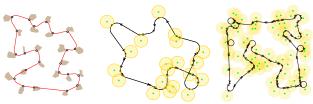

- ATSP → TSP, which can be solved optimally

In addition to Σ and headings Θ , locations P have to be determined.

Multi-Goal Path Planning Dubins Planning Data Collection Planning Mobile Robotic Exploration (TSP-based)

DTSPN – Examples of Solution

Váňa and Faigl (2015), (IROS) Faigl and Váňa (2016)

Autonomous Data Collection

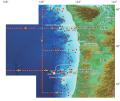

■ Having a set of sensors (sampling stations), we aim to determine a cost efficient path to retrieve data from the individual sensors

E.g., Sampling stations on the ocean floor

■ The planning problem is a variant of the Traveling Salesman Problem

PC-TSPN - Example of Solution

Ocean Observatories Initiative (OOI) scenario

- 1. Data from particular sensors may be of different importance
- 2. Data from the sensor can be retrieved using wireless communication

These two aspects can be considered in Prize-Collecting Traveling Salesman Problem (PC-TSP) and Orienteering Problem (OP) and their extensions with neighborhoods

DTSPN - Optimization Criterion

■ DTSPN is an optimization problem over all permutations Σ , headings $\Theta = \{\theta_{\sigma_1}, \dots, \theta_{\sigma_n}\}$ and points $P = (p_{\sigma_1}, \dots, p_{\sigma_n})$ for the states $(q_{\sigma_1}, \ldots, q_{\sigma_n})$ such that $q_{\sigma_i} = (p_{\sigma_i}, \theta_{\sigma_i})$ and $p_{\sigma_i} \in R_{\sigma_i}$:

$$\textit{minimize}_{\Sigma,\Theta,P} \qquad \sum_{i=1}^{n-1} \mathcal{L}(q_{\sigma_i}, q_{\sigma_{i+1}}) + \mathcal{L}(q_{\sigma_n}, q_{\sigma_1}) \tag{3}$$

subject to
$$q_i = (p_i, \theta_i), p_i \in R_i \ i = 1, \dots, n$$
 (4)

L $(q_{\sigma_i}, q_{\sigma_i})$ is the length of the shortest possible Dubins maneuver connecting the states q_{σ_i} and q_{σ_i} .

Prize-Collecting Traveling Salesman Problem with

Let *n* sensors be located in \mathbb{R}^2 at the locations $S = \{s_1, \dots, s_n\}$

lacksquare Let the data collecting vehicle operates in \mathbb{R}^2 with the motion cost

■ Each sensor has associated penalty $\zeta(s_i) > 0$ characterizing

■ The data from s_i can be retrieved within δ distance from s_i

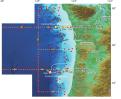

Dubins Planning Data Collection Planning

additional cost if the data are not retrieved from si

 $c(p_1, p_2)$ for all pairs of points $p_1, p_2 \in \mathbb{R}^2$

Neighborhoods (PC-TSPN)

Two practical aspects of the data collection can be identified

A4M36PAH - Lecture 10: Multi-Goal Plannin

PC-TSPN - Optimization Criterion

The PC-TSPN is a problem to

- Determine a set of unique locations $G = \{g_1, \dots, g_k\}, k \leq n$ $g_i \in \mathbb{R}^2$, at which data readings are performed
- Find a cost efficient tour T visiting G such that the total cost C(T) of T is minimal

$$C(T) = \sum_{(g_{l_i}, g_{l_{i+1}}) \in T} c(g_{l_i}, g_{l_{i+1}}) + \sum_{s \in S \setminus S_T} \zeta(s), \tag{5}$$

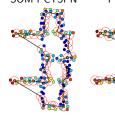

A4M36PAH - Lecture 10: Multi-Goal Planning

Dubins Planning Data Collection Planning Mobile Robotic Exploration (TSP-based)

where $S_T \subseteq S$ are sensors such that for each $s_i \in S_T$ there is g_i on $T = (g_{l_1}, \dots, g_{l_{k-1}}, g_{l_k})$ and $g_{l_i} \in G$ for which $|(s_i, g_{l_i})| \leq \delta$.

- PC-TSPN includes other variants of the TSP
 - for $\delta = 0$ it is the PC-TSP
 - for $\zeta(s_i) = 0$ and $\delta > 0$ it is the TSPN
 - for $\zeta(s_i) = 0$ and $\delta = 0$ it is the ordinary TSP

Communication radius p [km]

Faigl and Hollinger (2014) - IROS

A4M36PAH - Lecture 10: Multi-Goal Plannin

Orienteering Problem

- The Orienteering Problem (OP) originates from the orienteering outdoor sport
- The problem is to collect as many rewards as possible within the given travel budget
- It is similar to the PC-TSP, but the tour length must not exceed the prescribed maximize tour length T_{max}
- In OP, the starting and termination locations are prescribed, and they can be different

The solution may not be a closed tour as in the TSP

regions $\boldsymbol{G} = \{R_1, \dots, R_n\}$ by the Dubins vehicle

Salesman Problem with Neighborhoods (DTSPN)

Dubins Traveling Salesman Problem with Neighborhoods

■ In surveillance planning, it may be required to visit a set of target

■ Then, for each target region R_i , we have to determine a particular

point of the visit $p_i \in R_i$ and DTSP becomes the Dubins Traveling

Also called Set TSP or Covering Salesman Problem Notice For Dubins vehicle, it is the Generalized Asymmetric TSP (GATSP)

The problem is to determine a shortest tour in a graph that visits

The TSP is a special case of the GTSP when each subset to be visited

Noon and Bean (1991)

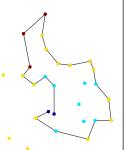

- ATSP can be solved by LKH

E.g., by Concorde

A4M36PAH - Lecture 10: Multi-Goal Planning

Orienteering Problem - Specification

- Let the given set of *n* sensors be located in \mathbb{R}^2 with the locations $S = \{s_1, \dots, s_n\}$,
- **Each** sensor s_i has an associated score ς_i characterizing the reward if data from s_i are
- The vehicle is operating in \mathbb{R}^2 and the travel cost is the Euclidean distance
- The starting and termination locations are prescribed
- We aim to determine a subset of k locations $S_k \subseteq S$ that maximizes the sum of the collected rewards while the travel cost to visit them is below T_{max} .

A4M36PAH - Lecture 10: Multi-Goal Planning Multi-Goal Path Planning Dubins Planning Data Collection Planning Mobile Robotic Exploration (TSP-based)

Orienteering Problem with Neighborhoods

■ Similarly to the TSP with Neighborhoods and PC-TSPN we can formulate the Orienteering Problem with Neighborhoods.

Jan Faigl, 2016

 T_{max} =45, δ =1.5, R=1344

Orienteering Problem - Optimization Criterion

- Let $\Sigma = (\sigma_1, \dots, \sigma_k)$ be a permutation of k sensor labels, $1 \le \sigma_i \le$ *n* and $\sigma_i \neq \sigma_i$ for $i \neq j$
- Let the start and end points of the tour be $\sigma_1 = 1$ and $\sigma_k = n$
- The Orienteering problem (OP) is to determine the number of sensors k, the subset of sensors S_k , and their sequence Σ such that

The OP combines the problem of determining the most valuable locations S_k with finding the shortest tour T visiting the locations S_k . It is NP-hard, since for $s_1 = s_n$ and particular S_k it becomes the TSP.

an Faigl, 2016

Select the next robot goal

Multi-Robot Exploration – Problem Definition

set of m robots $\mathbf{R} = \{r_1, r_2, \dots, r_m\}$

Exploration is an iterative procedure:

1. Collect new sensor measurements

2. Determinate a set of goal candidates

3. At time step t, select next goal for each

robot as the task-allocation problem

4. Navigate robots towards goal

Performance metric:

Time to create the map of the whole environment

A problem of creating a grid map of the unknown environment by a

search and rescue mission

TSP distance cost improves performance about 10-30%

using the distance cost function

Multi-Goal Path Planning Dubins Planning Data Collection Planning Mobile Robotic Exploration (TSP-based)

IROS, 2012, 3741-3741.

Multi-Robot Exploration Strategy

- \blacksquare A set of m robots at positions R = $\{r_1, r_2, \ldots, r_m\}$
- At time t, let a set of n goal candidates be $G(t) = \{g_1, \dots, g_n\}$

Multi-Goal Path Planning Dubins Planning Data Collection Planning Mobile Robotic Exploration (TSP-based)

Select a goal $g \in G(t)$ for each robot $r \in R$ that will minimize the required time to explore the environment.

A4M36PAH - Lecture 10: Multi-Goal Planning

The problem is formulated as the task-allocation problem

$$(\langle r_1, g_{r_1} \rangle, \dots, \langle r_m, g_{r_m} \rangle) = \operatorname{assign}(\boldsymbol{R}, \boldsymbol{G}(t), \mathcal{M}),$$

where M is the current map

We consider only the distance cost for the assignment

5. If $|\mathbf{G}(t)| > 0$ go to Step 1; otherwise terminate

 $\boldsymbol{G}(t) = \{g_1, g_2, \dots, g_n\}$

Proposed Multiple Traveling Salesman Approach

- Consider the task-allocation problem as the Multiple Traveling Salesman Problem (MTSP)
- MTSP heuristic ⟨cluster-first, route-second⟩
 - 1. Cluster the goal candidates \boldsymbol{G} to m clusters $\mathbf{C} = \{C_1, \ldots, C_m\}, C_i \subseteq \mathbf{G}$

2. For each robot $r_i \in \mathbf{R}, i \in \{1, \dots m\}$ select the next goal g_i from C_i using the TSP distance cost

Kulich et at., ICRA (2011)

- Solve the TSP on the set $C_i \cup \{r_i\}$
- the tour starts at ri \blacksquare The next robot goal g_i is the first goal of the found TSP tour

A4M36PAH - Lecture 10: Multi-Goal Planning

Goal Assignment using Distance Cost in Multi-Robot Exploration Jan Faigl, Miroslav Kulich and Libor Přeučil

 $(\langle r_1, g_{r_1} \rangle, \dots, \langle r_m, g_{r_m} \rangle) = \operatorname{assign}(\boldsymbol{R}, \boldsymbol{G}(t), \mathcal{M}(t))$

A4M36PAH - Lecture 10: Multi-Goal Planning

- lacksquare Σ defines a tour $T=(s_{\sigma_1},\ldots,s_{\sigma_k})$ visiting the selected sensors S_k

Comparison – Goal Assignment Strategies

1. Greedy Assignment

Yamauchi B, Robotics and Autonomous Systems 29, 1999

■ Randomized greedy selection of the closest goal candidate

2. Iterative Assignment

Werger B, Mataric M, Distributed Autonomous Robotic Systems 4, 2001

■ Centralized variant of the broadcast of local eligibility algorithm (BLE)

3. Hungarian Assignment

■ Optimal solution of the task-allocation problem for assignment of n goals and m robots in $O(n^3)$

Stachniss C, C implementation of the Hungarian method, 2004

4. MTSP Assignment

(cluster-first, route-second), the TSP distance cost

In all strategies, we use the identical selection of the goal candidates from the frontiers.

Statistical Evaluation of the Exploration Strategies

Iterative

Greedy

Evaluation for the number of robots m and sensor range ρ

MTSP

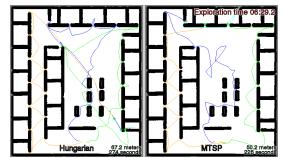

vs

Hungarian

Total number of trials 14 280

Performance of the MTSP vs Hungarian Algorithm

■ Replanning as quickly as possible; $m = 3, \rho = 3$ m

The MTSP assignment provides better performance
