

Assignment

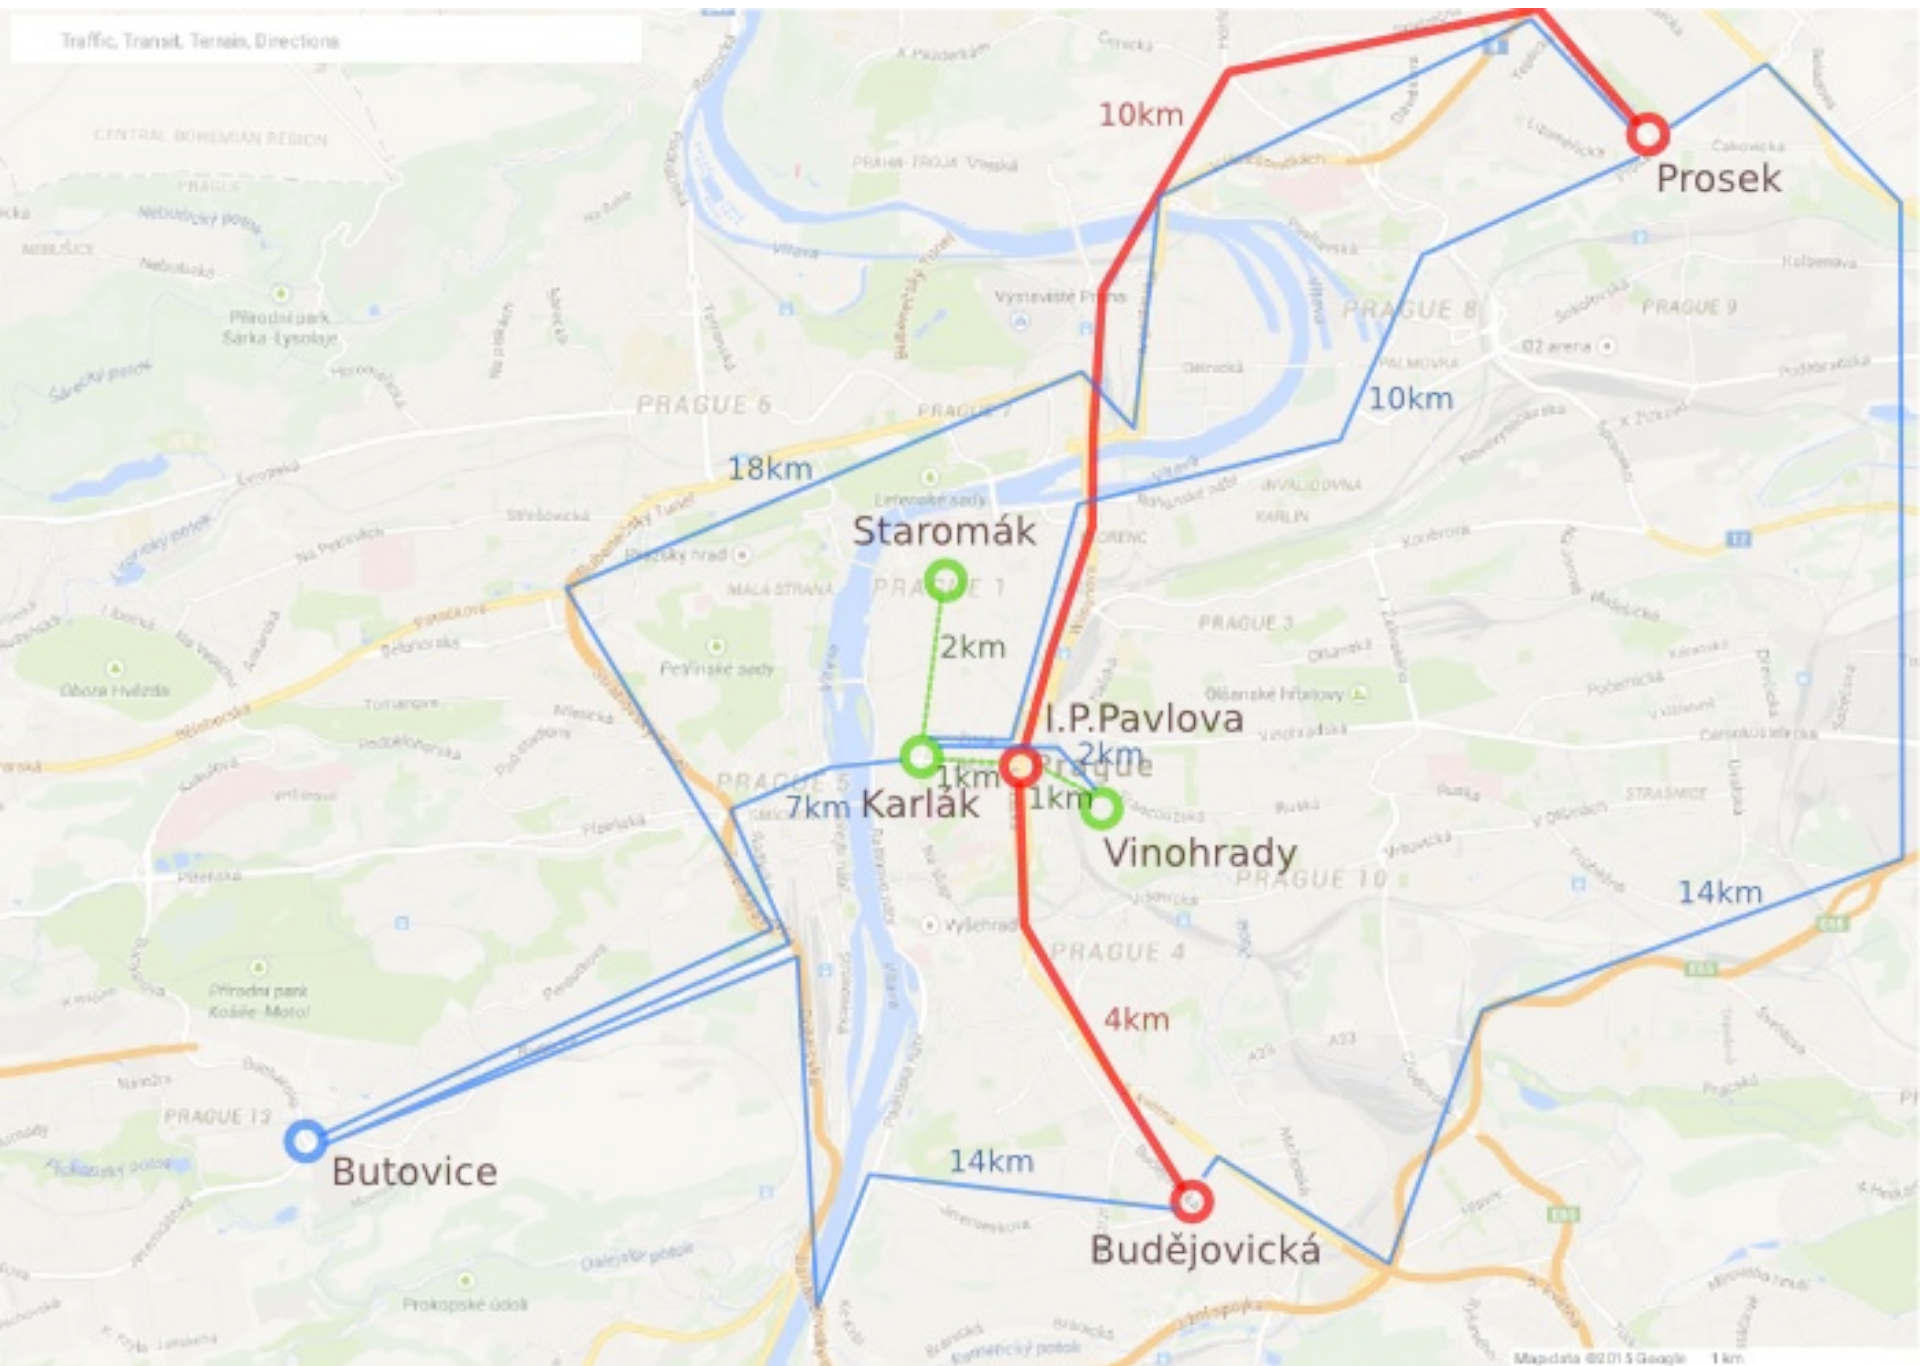

PAH (Planning and Games)

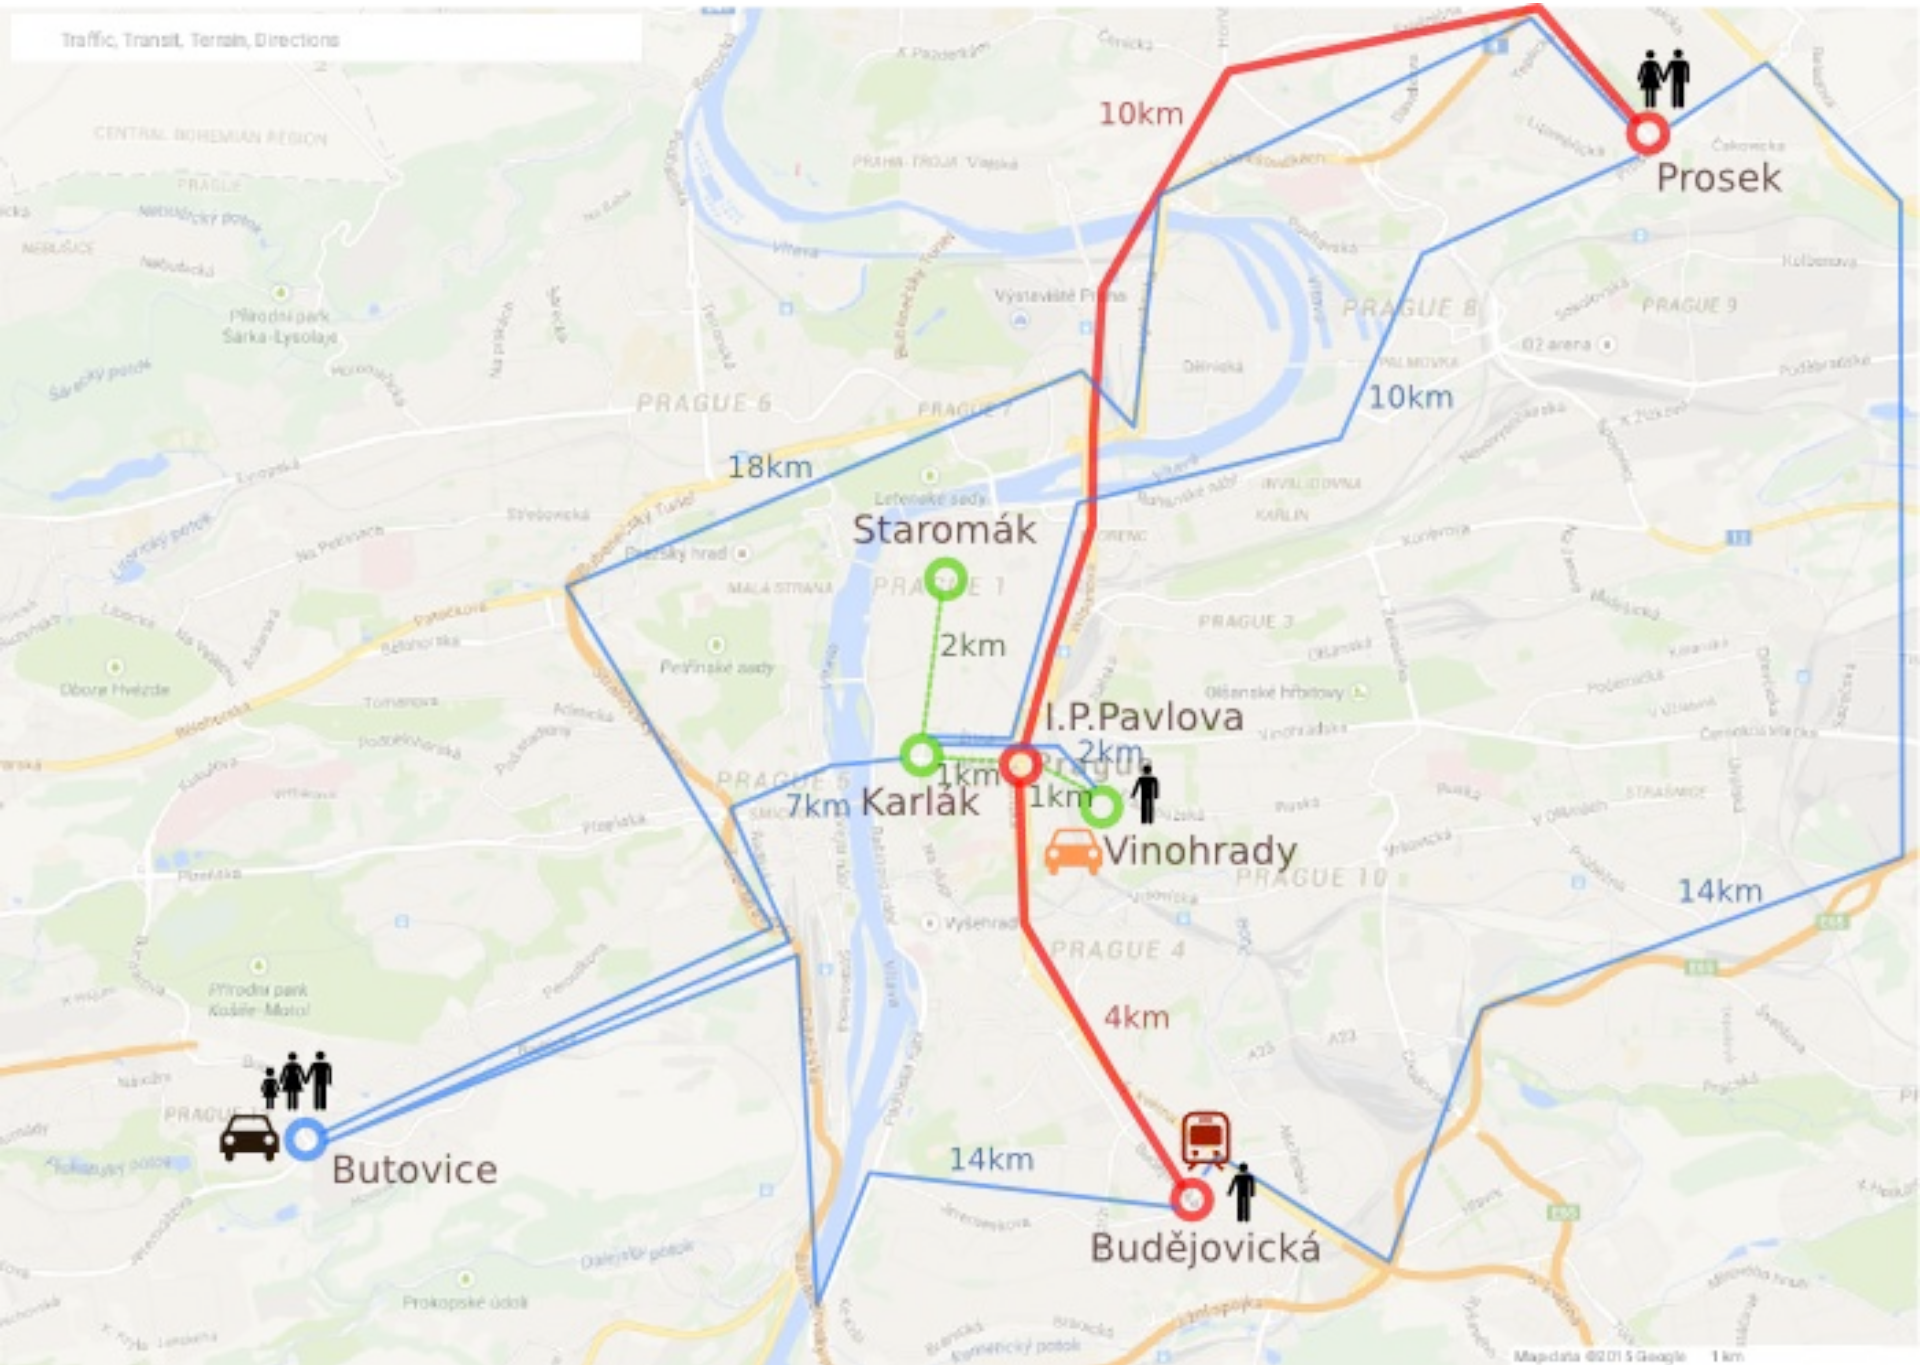

Michal Štolba

michal.stolba@agents.fel.cvut.cz

Assignment

- Formalize the 'simcity' problem
 - Find a 'day plan' for a set of people
 - Each person lives somewhere and works somewhere
 - Some people may be related (family)
 - The people travel on a multimodal transport graph using various vehicles
- <http://cw.fel.cvut.cz/wiki/courses/a4m36pah/assignments/assignment1>

Vehicles

- Each vehicle needs a driver to operate
- Not all people can board all vehicles (a family car)
- Driving a taxi or public transport counts as work

Simcity level: basic

- Basic problem description
- Some walk-only edges
- At least one car
- At least one taxi
- At least one public transport vehicle

Simcity level: costs

- Add costs
 - Based on 'real' distances
- A cost of boarding a vehicle, a cost of riding a vehicle
 - Not all vehicles have both
- Try two types of cost
 - Money, time,

Simcity level: complex

- Add some of the following:
- Capacity of vehicles (using only STRIPS)
 - (car have only 4 seats)
- Leave vs. Park
 - Difference between leavin a vehicle and parking it
- Fuel (using only STRIPS)
- Come-up with your own (non-trivial)

Your task

- Formalize problem 'simcity' in PDDL
- Use 3 selected planners to evaluate
- Create PDF report

Formalize problem 'simcity' in PDDL

- 3 domains, 2 problems for each
- Domains
 - 1x domain per level
 - 1x domain basic, 2x domain cost/complex (can be the same)
 - 3x domain basic
- Problems
 - Each problem different (even if the domain is the same)
 - Different sizes, metrics, etc.

Create PDF report

- (Ideally in LaTeX)
- Description of the location, transport graph, people, vehicles (brief)
- Specify which problem levels and features were formalized
 - Specify your own enhancements in-detail
- Brief description of used predicates, actions and functions
- List of the selected planners, parameters of the testing env.
- Execution time and solution quality graphs
- Conclusion

Use 3 selected planners to evaluate

- Select 3 of the provided planners
 - One should be optimal: fd-ms, fd-lmcut or symba
- Run all planners on all problems
- On each problem, at least one planner must find a solution
 - Can be different planner every time
