## Talk overview

- Incremental construction
- Voronoi diagram of line segments
- VD of order k
- Farthest-point VD

## Incremental construction - bounded cell

## Incremental construction - unbounded cell

## Incremental construction algorithm

InsertPoint(S, Vor(S), y ) ... y = a new site
Input: Point set S, its Voronoi diagram, and inserted point yùS
Output: VD after insertion of $y$

1. Find the cell $\mathrm{V}(x)$ in which $y$ falls, set $c=$ undef $\ldots \mathrm{O}(\log n)$
2. Detect the intersections $\{a, b\}$ of bisector $L(x, y)$ with boundary of cell $V(x)$ $=>$ * first edge $e=a b$ on the border of cells of sites $x$ and $y \ldots O(n)$
3. $p=b$, site $z=$ neighbor site across the border with point $b \ldots \mathrm{O}(1)$
4. while( exists(p) and $c$ û a ) // trace the bisectors from $b$ in one direction
a. Detect the intersection $c$ of bisector $L(z, y)$ with $V(z)$
b. Report Voronoi edge $p c$
c. $p=c, z=$ neighbor site across border with $c$
5. if( c û a ) then // trace the bisectors from a in other direction
a. $p=a$
b. while( exists $(p)$ and $c$ û b)
a. Detect the intersection $c$ of bisector $L(z, y)$ with $V(z)$
b. Report Voronoi edge pc

地 $+c$ c. $p=\underline{c}, z=$ neighbor site across border with $c$
$+\mathrm{O}\left(n^{2}\right)$ worst-case, $\mathrm{O}(n)$ expected time for some distributions

## Voronoi diagram of line segments

## VD of line segments with bounding box

## Bisector of 2 line-segments in detail

- Consists of line segments and parabolic arcs

Distance from point-to-object is measured to the closest point on the object (perpendicularly to the object silhouette)

- Line segment - bisector of end-points or of interiors
- Parabolic arc - of point and interior of a line segment

## Bisector in greater details

Bisector of two line segment interiors

Bisector of (end-)point and line segment interior (in intersection of perpendicular slabs only)

## Voronoi diagram of line segments

- More complex bisectors of line segments
- line segments and parabolic arcs
- Still combinatorial complexity of O(n)
- Assumptions on the input line segments:
- non-crossing
- strictly disjoint end-points (slightly shorten the segm.)

## Voronoi diagram of line segments

- Variant with touching segments in their end-points
- Two types of Voronoi vertices:
- Type 3 - three different objects
- Type 2 - two objects (segment and one of its end-points)
- Contains also 2D areas
- Not only 1D line segments and parabolic arcs

## VD of points and line segments examples

## 2 points Point \& segment 2 line segments

## Beach line

$=$ Points with distance to the closest site above sweep line $l$ equal to the distance to $l$

- Beach line contains
- parabolic arcs when closest to a site end-point
- straight line segments when closest to a site interior (or just the part of the site interior above $l$ if the site $s$ intersects $l$ )
(This is the shape of the beach line)

## Beach line breakpoints types

## Breakpoint $p$ is equidistant from $l$ and

 equidistant and closest to:1. two site end-points $\quad=>p$ traces a VD line segment
2. two site interiors $\quad=>p$ traces a VD line segment
3. end-point and interior $=>p$ traces a VD parabolic arc
4. one site end-point $\quad=>p$ traces a line segment (border of the slab perpendicular to the site)
5. site interior intersects $=>p=$ intersection, traces the scan line $l$ the input line segment
Cases 4 and 5 involve only one site and therefore do not form a Voronoi diagram edge (are used by alg.only)

## Breakpoints types and what they trace

[Berg]

- 1,2 trace a Voronoi line segment (part of VD edge) draw
- 3 traces a Voronoi parabolic arc (part of VD edge) draw
- 4,5 trace a line segment (used only by the algorithm) моve
- 4 limits the slab perpendicular to the line segment
- 5 traces the intersection of input segment with a sweep line
(This is the shape of the traced VD arcs)

## Site event - sweep line reaches an endpoint

I. At upper endpoint of ${ }^{\bullet}$

- Arc above is split into two
- 4 new arcs are created (2 segments + 2 parabolas)
- Breakpoints for 2 segments are of type 4-5-4
- Breakpoints for parabolas depend on the surrounding sites
- Type 1 for two end-points
- Type 3 for endpoint and interior
- etc...

## Site event - sweep line reaches an endpoint

II. At lower endpoint of $\boldsymbol{\imath}$

- Intersection with interior (breakpoint of type 5)

- is replaced by two breakpoints (of type 4) with parabolic arc between them

## Circle event - lower point of circle of 3 sites

- Two breakpoints meet (on the beach-line)
- Solution depends on their type
- Any of first three types meet
- 3 sites involved - Voronoi vertex created
- Type 4 with something else
- two sites involved - breakpoint changes its type
- Voronoi vertex not created
(Voronoi edge may change its shape)
- Type 5 with something else
- never happens for disjoint segments (meet with type 4 happens before)

## Summary of the VD terms

- Site = input point, line segment, ...
- Cell = area around the site, in $\mathrm{VD}_{1}$ the nearest to site
- Edge, arc = part of Voronoi diagram (border between cells)
- Vertex = intersection of VD edges

## Motion planning example - retraction Rušení rran

## Motion planning example - retraction Rušení rran

Find path for a circular robot of radius $r$ from $Q_{\text {start }}$ to $Q_{\text {end }}$

- Create Voronoi diagram of line segments, take it as a graph
- Project $Q_{\text {start }}$ to $P_{\text {start }}$ on VD and $Q_{\text {end }}$ to $P_{\text {end }}$
- Remove segments with distance to sites smaller than radius $r$ of a robot
- Depth first search if path from $P_{\text {start }}$ to $P_{\text {end }}$ exists
- Report path $Q_{\text {start }} P_{\text {start }}$..path... $P_{\text {end }}$ to $Q_{\text {end }}$
- $O(n \log n)$ time using $O(n)$ storage

## Order-2 Voronoi diagram

## Construction of V(3,5) = V(5,3)

[Nandy]
Intersection of all halfplanes $\quad \bigcap h(3, x) \cap \bigcap h(5, x)$

## Order-2 Voronoi edges

edge : set of centers of circles passing through 2 sites $s$ and $t$ and containing one site $p$ $=c_{p}(\mathrm{~s}, \mathrm{t})$

## Question

Which are the regions on both sides of $\mathrm{c}_{\mathrm{p}}(\mathrm{s}, \mathrm{t})$ ?
$=>\mathrm{V}(\mathrm{p}, \mathrm{s})$ and $\mathrm{V}(\mathrm{p}, \mathrm{t})$

## Order-2 Voronoi vertices

## Order-2 Voronoi vertex $u_{\varnothing}(Q+p)$

## Order-k Voronoi Diagram

## Theorem vêta

The size of the order-k diagrams is $\mathrm{O}(\mathrm{k}(\mathrm{n}-\mathrm{k}))$

## Theorem věta

The order-k diagrams can be constructed from the order-( $\mathrm{k}-1$ ) diagrams in $\mathrm{O}(\mathrm{k}(\mathrm{n}-\mathrm{k}))$ time

Corollary dûsledek
The order-k diagrams can be iteratively constructed

## Order n-1 = Farthest-point Voronoi diagram

cell $\mathrm{V}_{-1}(7)=\mathrm{V}_{\mathrm{n}-1}(\{1,2,3,4,5,6\})$
= set of points in the plane farther from $p_{i}=7$ than from any other site
$\operatorname{Vor}_{-1}(P)=\operatorname{Vor}_{n-1}(P)$ = partition of the plane formed by the farthest point Voronoi regions, their edges, and vertices

## Farthest-point Voronoi diagrams example

## Roundness of manufactured objects

- Input: set of measured points in 2D
- Output: width of the smallest-width annulus mezikuži s nejmensis sirikou (region between two concentric circles $\mathrm{C}_{\text {inner }}$ and $\mathrm{C}_{\text {outer }}$ )
Three cases to test - one will win:

## Smallest width annulus - cases with 3 pts

b) $\mathrm{C}_{\text {inner }}$ contains at least 3 points

- Center is the vertex of normal Voronoi diagram ( $1^{\text {st }}$ order VD)
- The remaining point on $\mathrm{C}_{\text {outer }}$ in $\mathrm{O}(\mathrm{n})$ for each vertex $=$ not the alagest (ingeribeded empyy circe a as disusused on seminar as we must test all VD vertices in combination with point on C outer

a) $\mathrm{C}_{\text {outer }}$ contains at least 3 points
- Center is the vertex of the farthest Voronoi diagram
- The remaining point on $\mathrm{C}_{\text {inner }}^{+}$in $\mathrm{O}(\mathrm{n})=$ nothe smalsestercosing girive - asd disusised of seminar as we must test all vertices in combination with point on C inner

## Smallest width annulus - case with 2+2 pts

c) $\mathrm{C}_{\text {inner }}$ and $\mathrm{C}_{\text {outer }}$ contain 2 points each

- Generate vertices of overlay of Voronoi (__) and farthest-point Voronoi (---) diagrams => $\mathrm{O}\left(\mathrm{n}^{2}\right)$ candidates for centers (we need only vertices, not the complete overlay)
- annulus computed in O(1) from center and 4 points (same for all 3 cases)
- $O\left(n^{2}\right)$

## Smallest width annulus

## Smallest-Width-Annulus

Input: $\quad$ Set $P$ of $n$ points in the plane
Output: Smallest width annulus center and radii $r$ and $R$ (roundness)

1. Compute Voronoi diagram $\operatorname{Vor}(P)$ and farthest-point Voronoi diagram $\operatorname{Vor}_{-1}(P)$ of $P$
2. For each vertex of $\operatorname{Vor}_{-1}(P)(R)$ determine the closest point $(r)$ from $P$ => $O(n)$ sets of four points defining candidate annuli
3. For each vertex of $\operatorname{Vor}(P)(r)$ determine the farthest point $(R)$ from $P$ => $O(n)$ sets of four points defining candidate annuli
4. For every pair of edges $\operatorname{Vor}(P)$ and $\operatorname{Vor}_{-1}(P)$ test if they intersect => another set of four points defining candidate annulus
5. For all candidates of all three types chose the smallest-width annulus
$O\left(n^{2}\right)$ time using $O(n)$ storage

## Farthest-point Voronoi diagram

$\mathrm{V}_{-1}\left(p_{i}\right)$ cell
= set of points in the plane farther from $p_{i}$ than from any other site

Vor $_{-1}(\mathrm{P})$ diagram = partition of the plane formed by the farthest point Voronoi regions, their edges, and vertices

## Farthest-point Voronoi region (cell)

Computed as intersection of halfplanes, but we take "other sides" of bisectors

Construction of $\mathrm{V}_{-1}(7)$

$$
V_{-1}=\bigcap_{x=1}^{n} h(y, x), y \neq x
$$

## Property <br> The farthest point Voronoi regions are convex and unbounded

## Farthest-point Voronoi region

## Properties:

- Only vertices of the convex hull have their cells in farthest Voronoi diagram
- The farthest point Voronoi regions are unbounded
- The farthest point Voronoi edges and vertices form a tree (in the graph sense)

## Farthest point Voronoi edges and vertices

edge : set of points equidistant from 2 sites and closer to all the other sites

vertex : point equidistant from at least 3 sites and closer to all the other sites

## Application of Vor $_{-1}(\mathrm{P})$ : Smallest enclosing circle

- Construct Vor $_{-1}(P)$ and find minimal circle with center in $\operatorname{Vor}_{-1}(\mathrm{P})$ vertices or on edges

## Modified DCEL for farthest-point Voronoi d

- Half-infinite edges -> we adapt DCEL
- Half-edges with origin in infinity
- Special vertex-like record for origin in infinity
- Store direction instead of coordinates
- Next(e) or Prev(e) pointers undefined
- For each inserted site $p_{j}$
- store a pointer to the most CCW half-infinite half-edge of its cell in DCEL

## Idea of the algorithm

1. Create the convex hull and number the CH points randomly
2. Remove the points starting in the last of this
random order and store $\operatorname{cw}\left(p_{i}\right)$ and $\operatorname{ccw}\left(p_{i}\right)$ points at the time of removal.
3. Include the points back and compute $\mathrm{V}_{-1}$

| $p_{i}$ | $\operatorname{ccw}\left(p_{i}\right)$ | $\operatorname{cw}\left(p_{i}\right)$ |
| :---: | :---: | :---: |
| $p_{6}$ | $p_{3}$ | $p_{5}$ |
| $p_{5}$ | $p_{3}$ | $p_{2}$ |
| $\cdots$ |  |  |

## Farthest-point Voronoi d. construction

## Farthest-pointVoronoi

$O(n \log n)$ time in $O(n)$ storage
Input: Set of points $P$ in plane
Output: Farthest-point VD $\operatorname{Vor}_{-1}(P)$

1. Compute convex hull of $P$
2. Put points in $\mathrm{CH}(P)$ of $P$ in random order $p_{1}, \ldots, p_{h}$
3. Remove $p_{h}, \ldots, p_{4}$ from the cyclic order (around the CH ). When removing $p_{i}$, store the neighbors: $\operatorname{cw}\left(p_{i}\right)$ and $\operatorname{ccw}\left(p_{i}\right)$ at the time of removal. (This is done to know the neighbors needed in step 6.)
4. Compute $\operatorname{Vor}_{-1}\left(\left\{p_{1}, p_{2}, p_{3}\right\}\right)$ as init
5. for $i=4$ to $h$ do
6. Add site $\mathrm{p}_{\mathrm{i}}$ to $\operatorname{Vor}_{-1}\left(\left\{p_{1}, p_{2}, \ldots, p_{i-1}\right\}\right)$ between site $\operatorname{cw}\left(p_{i}\right)$ and $\operatorname{ccw}\left(p_{i}\right)$
7.     - start at most CCW edge of the cell $\operatorname{ccw}\left(p_{i}\right)$
8.     - continue CW to find intersection with bisector $\left(\operatorname{ccw}\left(p_{i}\right), p_{i}^{*}\right)$
9. 

- trace borders of Voronoi cell $p_{i}$ in CCW order, add edges

10. 

- remove invalid edges inside of Voronoi cell $p_{i}$

## Farthest-point Voronoi d. construction

## Farthest-point Voronoi d. construction
