Intersection of rectangles

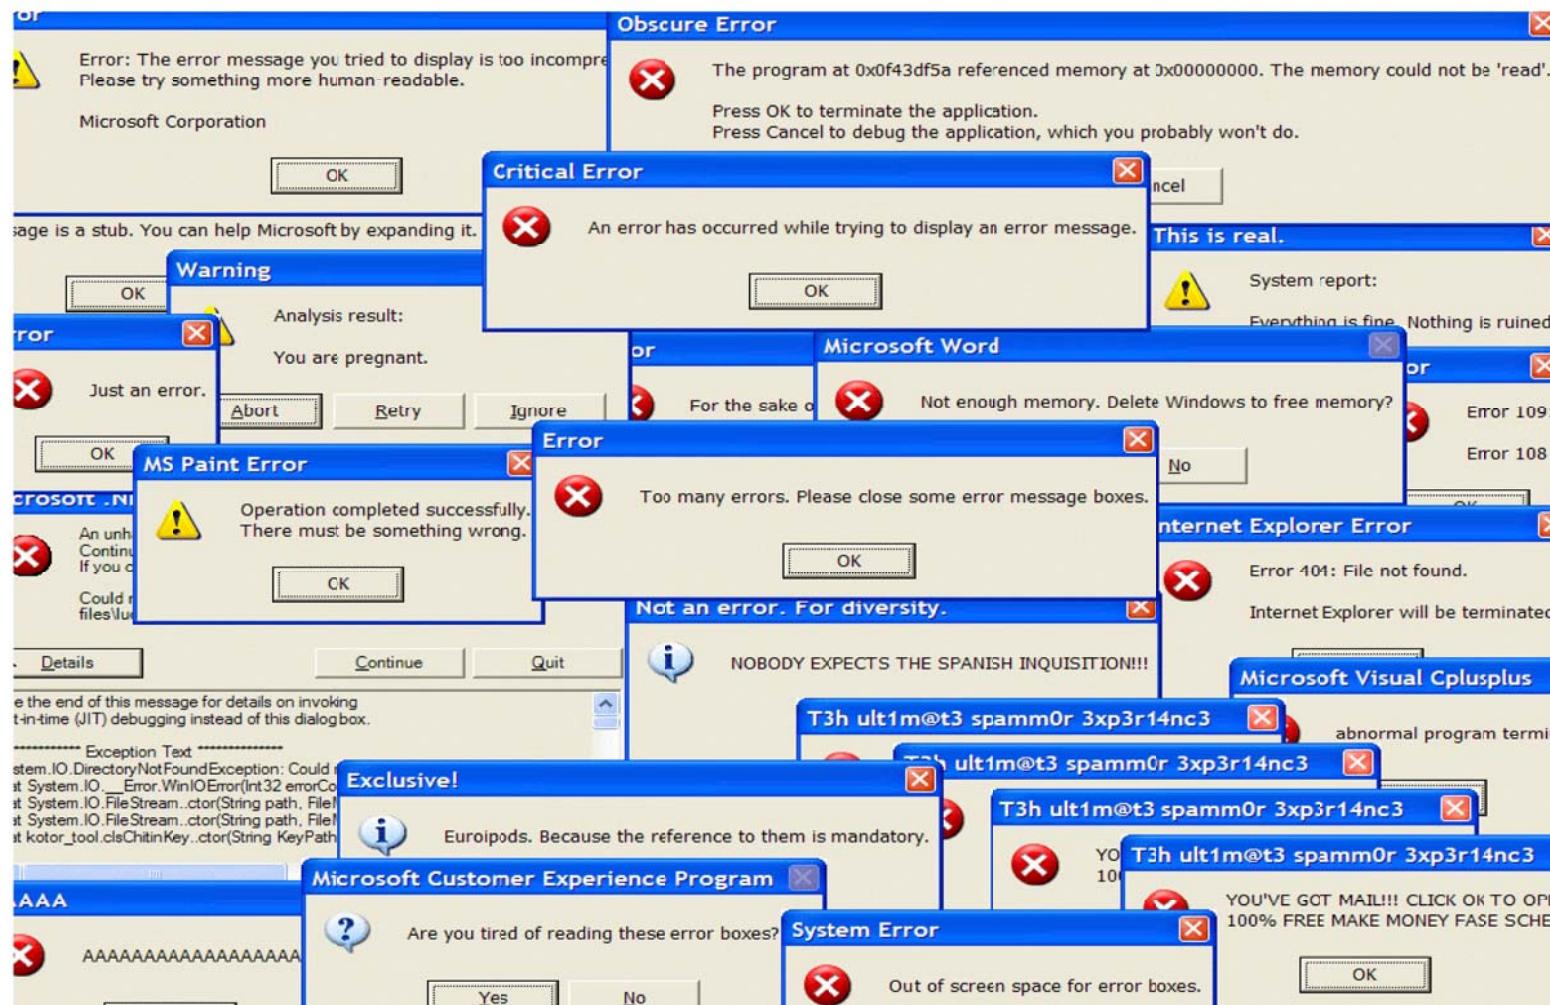

Computational Geometry presentation

22/11/2012

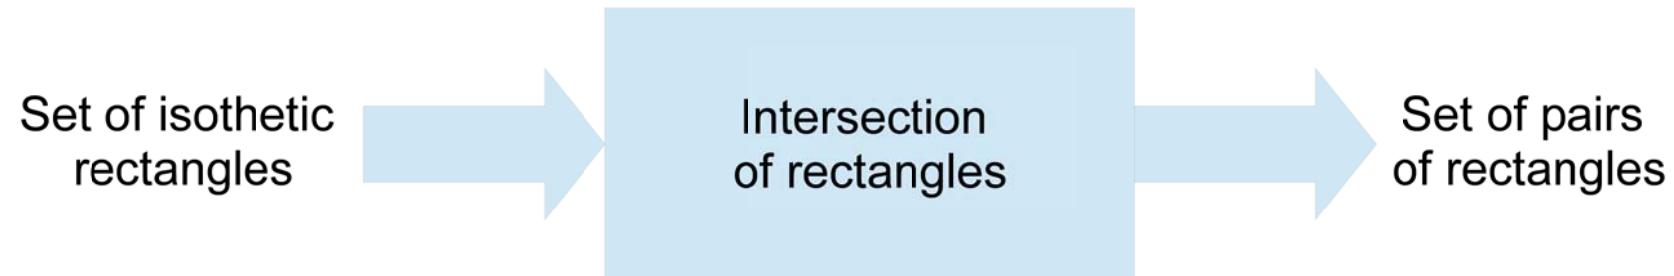

Plan

- Problem definition
- Sweep line
- Interval tree
- Summary

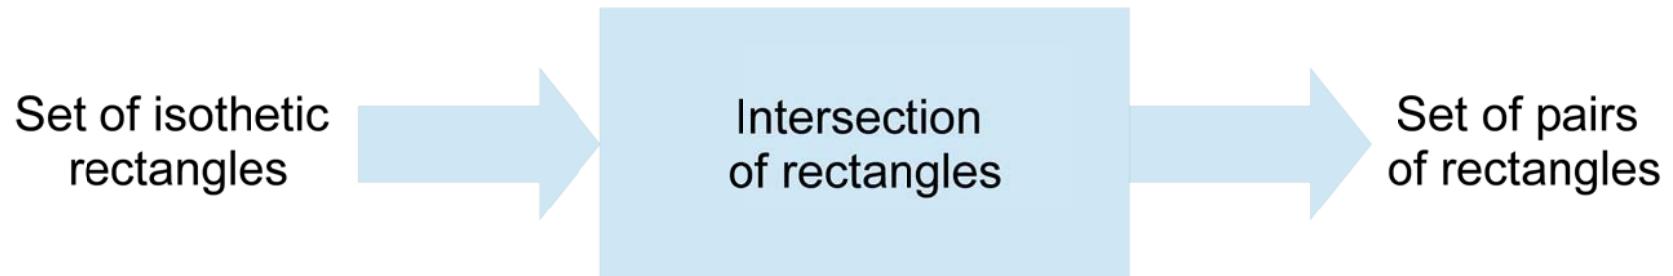

Windowing application

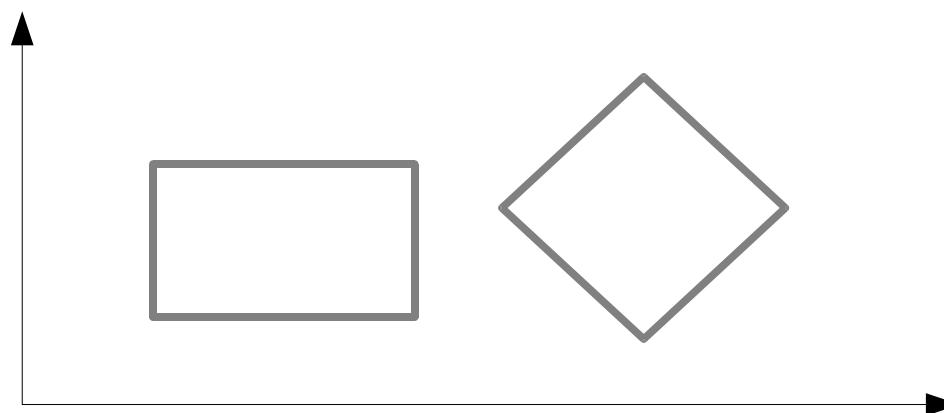

Problem definition

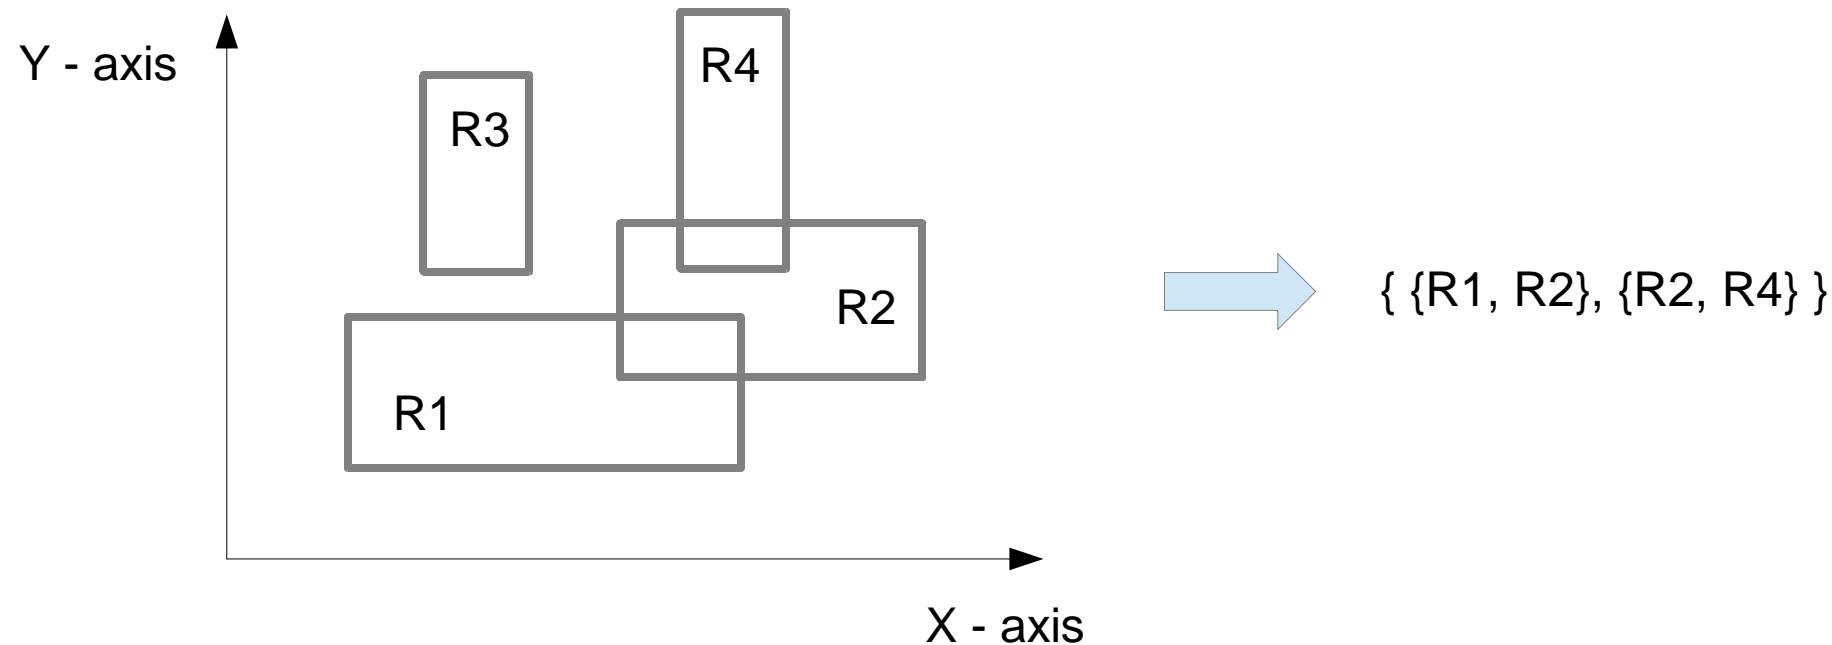

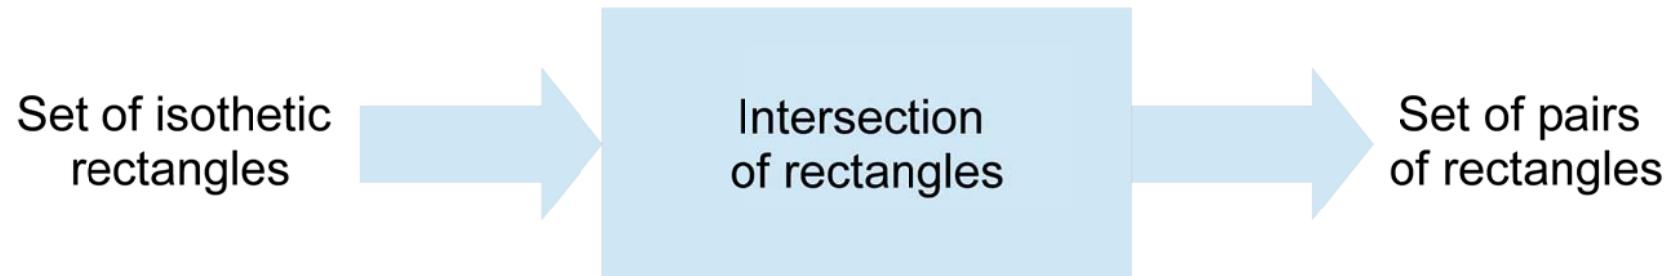

Problem definition

Isothetic rectangle : Each side is parallel to one axis.

Problem definition

Sweep line

- First step of the algorithm
- We assume that we can use a function :

OverlappingOnY(Q, R)

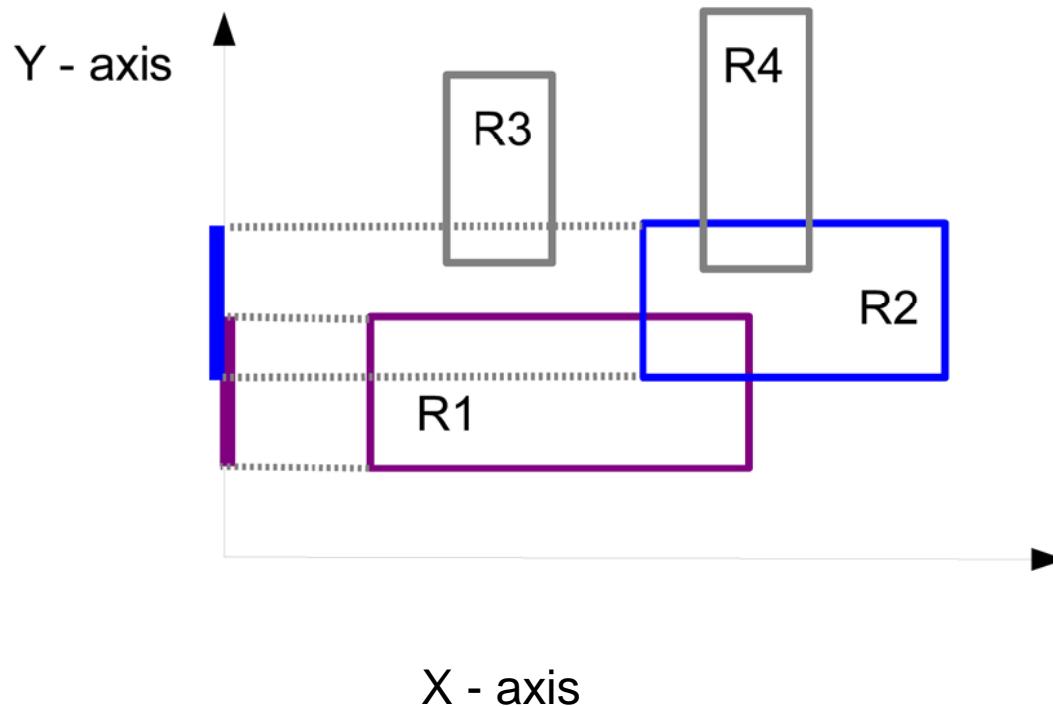

Input

- Q : a query rectangle
- R : a list of rectangles

Output :

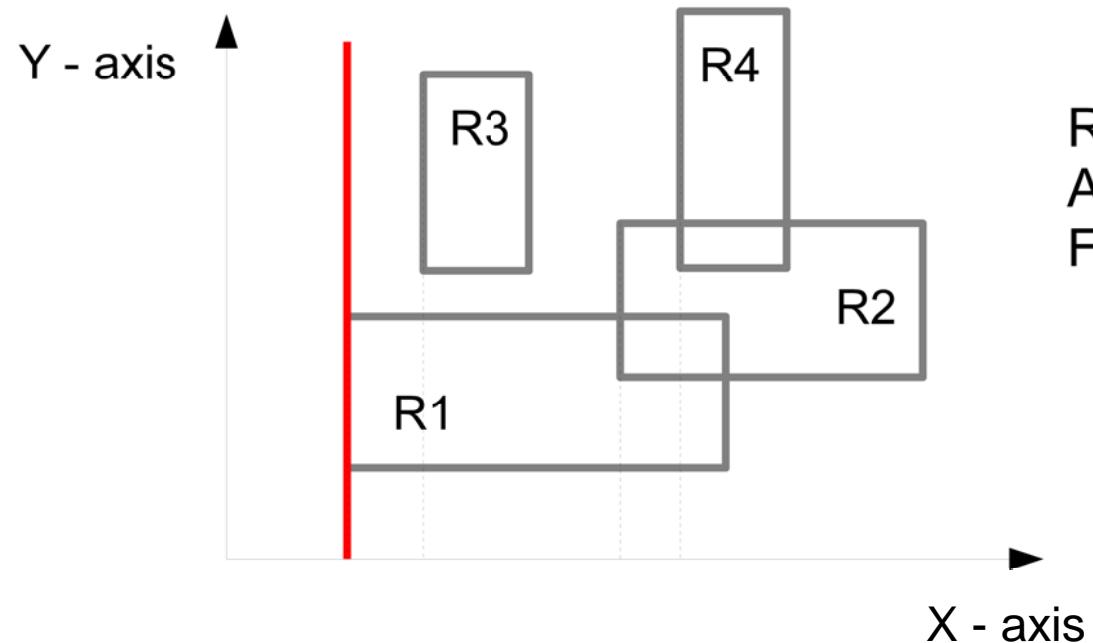

All the intersection pairs of the projection
of Q and R on Y axis.

Sweep line

$\text{OverlappingOnY(R1, \{R1, R2, R3, R4\}) = \{R1, R2\}}$

Sweep line

Res = {}

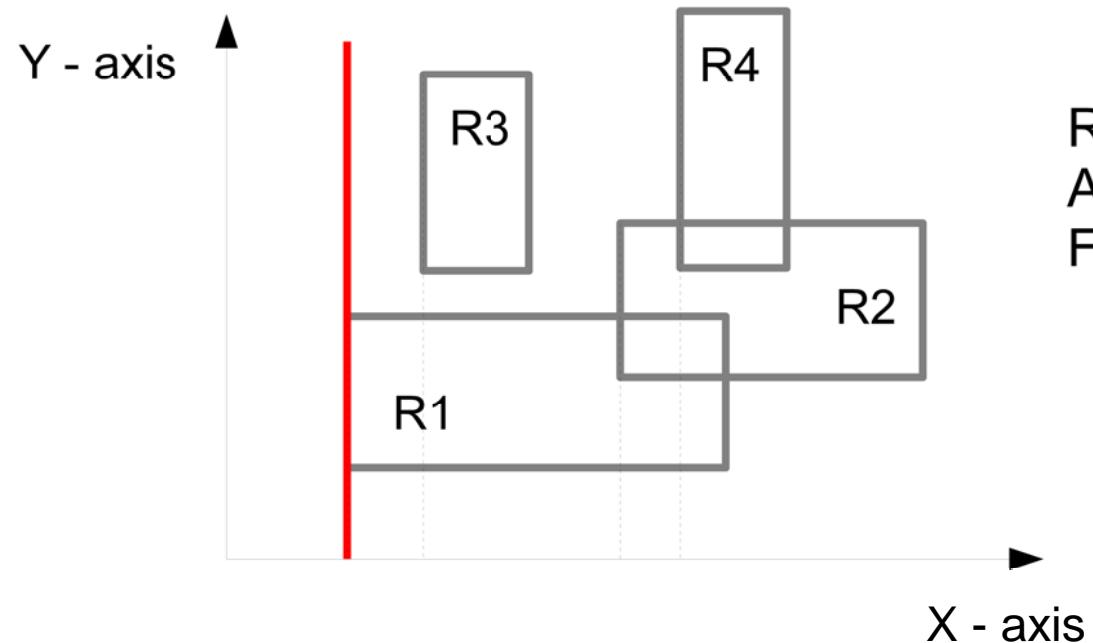

AR = {}

For each R reached by the sweep line

Update AR

Res = Res U OverlappingOnY(R, AR)

Sweep line

Res = {}

AR = {}

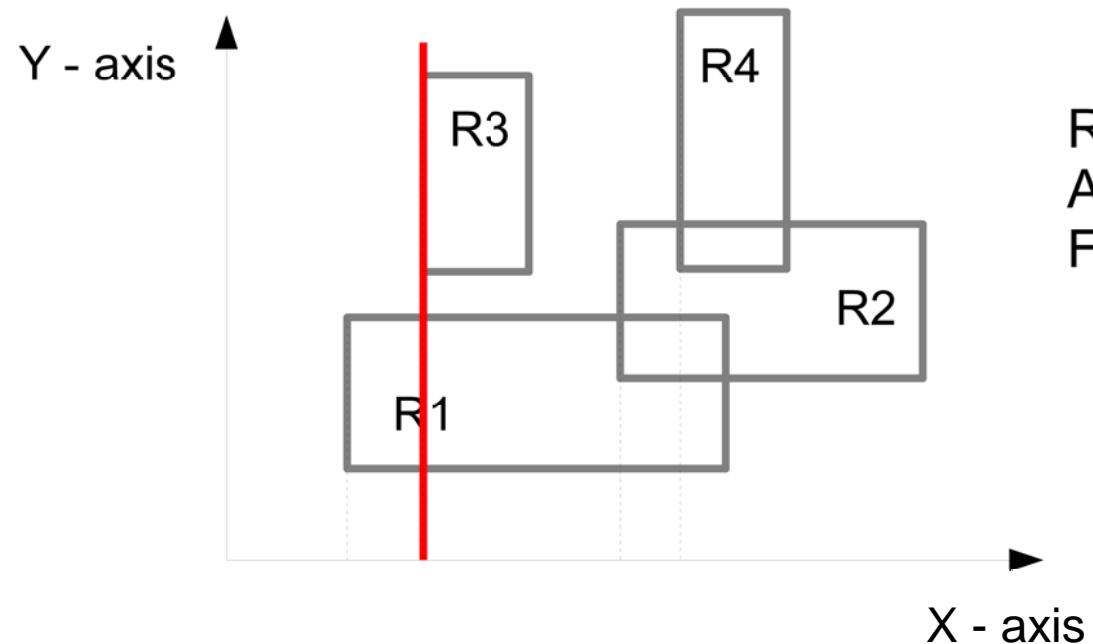

For each R reached by the sweep line
Update AR

Res = Res U OverlappingOnY(R, AR)

AR = {R1}

Res = {}

Sweep line

Res = {}

AR = {}

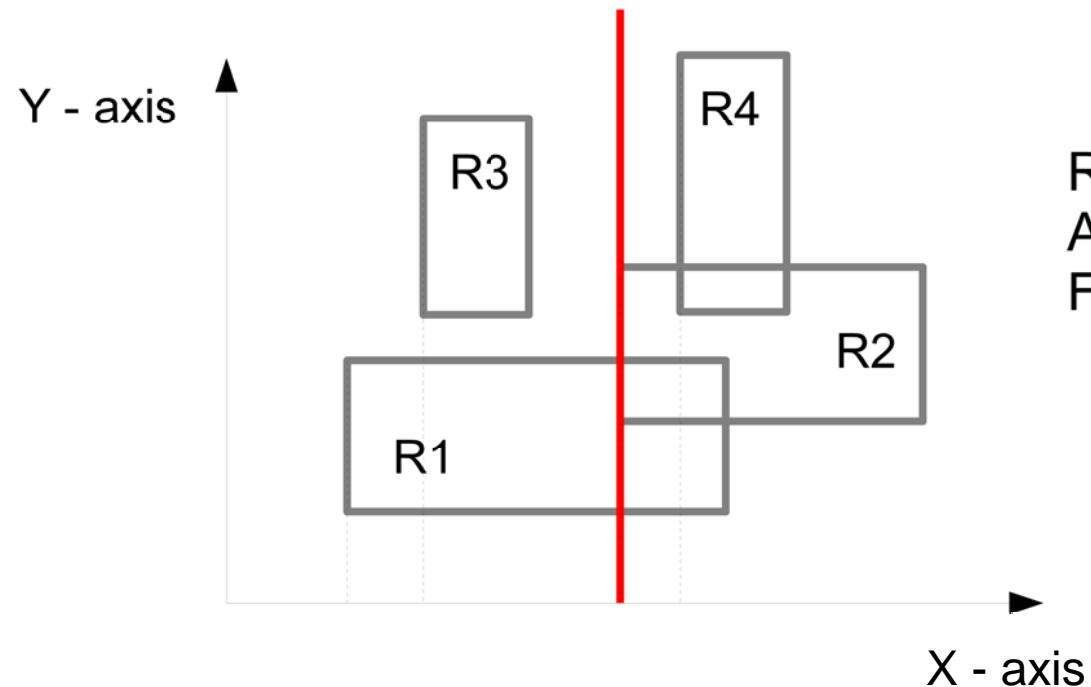

For each R reached by the sweep line
Update AR

Res = Res U OverlappingOnY(R, AR)

AR = {R1, R3}

Res = {}

Sweep line

Res = {}

AR = {}

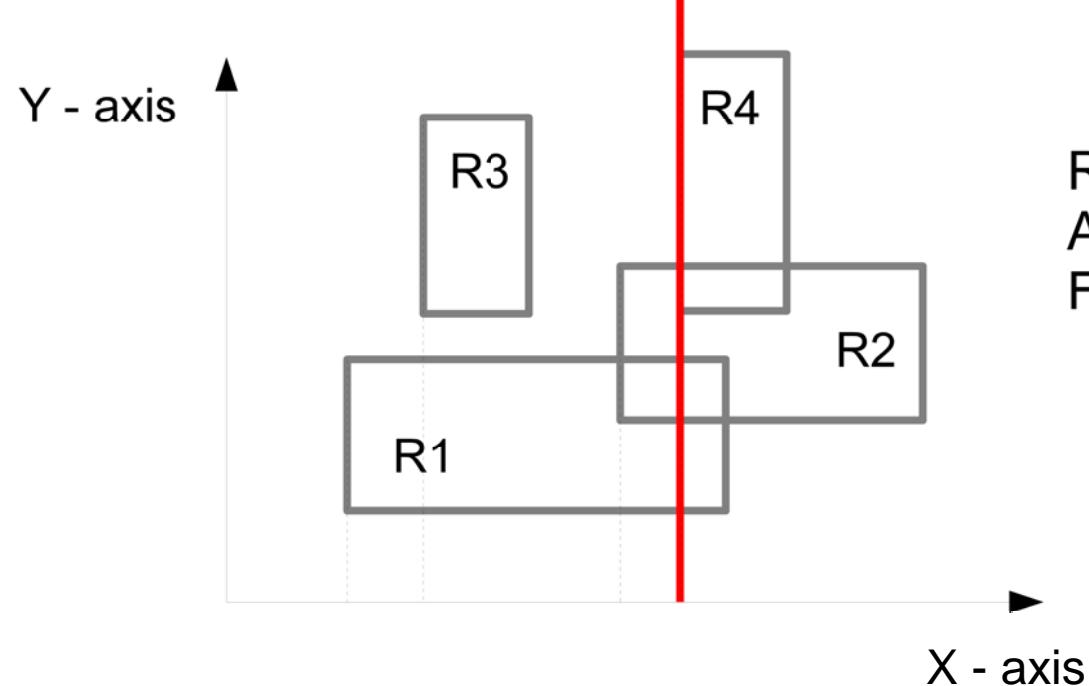

For each R reached by the sweep line
Update AR

Res = Res U OverlappingOnY(R, AR)

AR = {R1, R2}

Res = { {R1, R2} }

Sweep line

Res = {}

AR = {}

For each R reached by the sweep line

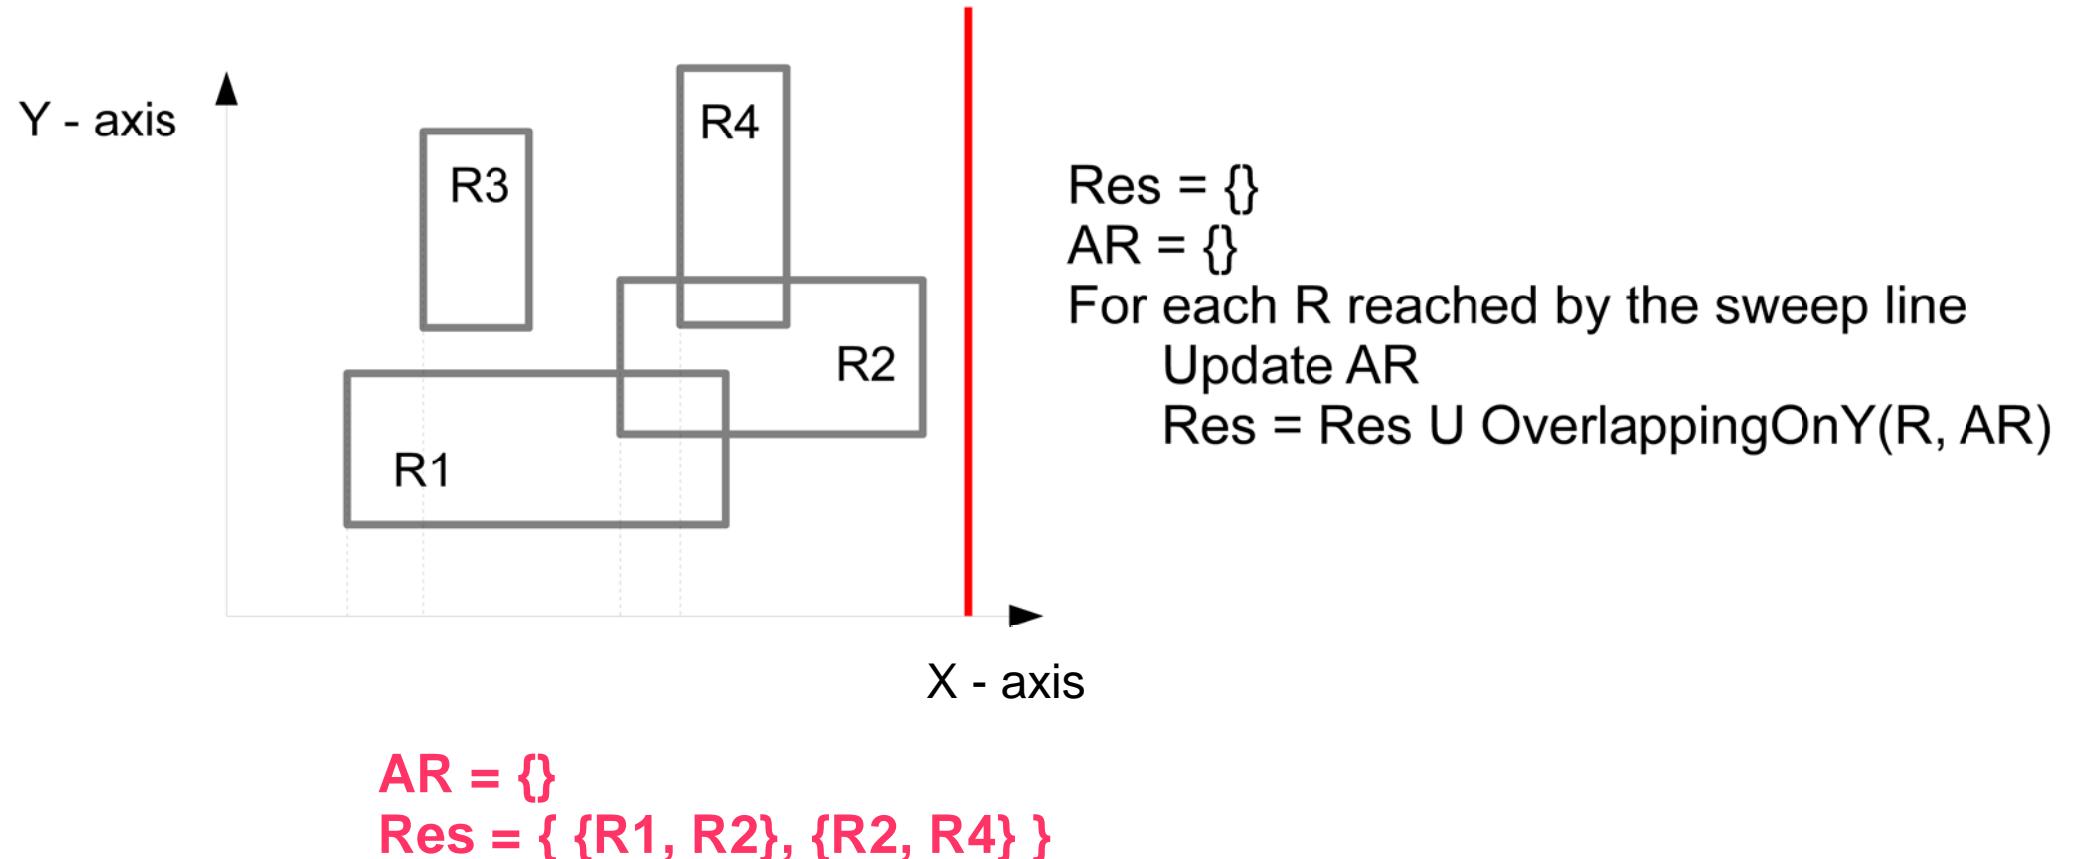

Update AR

Res = Res U OverlappingOnY(R, AR)

AR = {R1, R2, R4}

Res = { {R1, R2}, {R2, R4} }

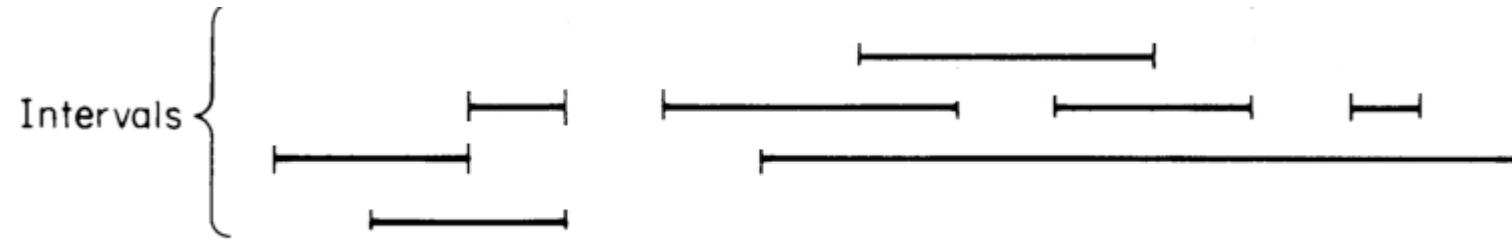

Sweep line

    For each right_endpt in w.right_list  
        If right_endpt >= Q.left  
            Res += interval(right_endpt)  
            Res += Overlapping_Search(w.right, Q)  
  
Return Res
```

Complexity

Preprocessing time (interval tree construction) :
 $O(N * \log(N))$

Optimal processing time :
 $O(N * \log(N) + k)$

Space complexity :
 $O(N)$

with N number of input rectangles and k number of output pairs.
