

# Input/Output and Standard C Library

Jan Faigl

Department of Computer Science  
Faculty of Electrical Engineering  
Czech Technical University in Prague

Lecture 06

B3B36PRG – C Programming Language

Jan Faigl, 2017 B3B36PRG – Lecture 06: I/O and Standard Library 1 / 50

## Text vs Binary Files

- There is not significant difference between text and binary files from the machine processing perspective
- Text files are oriented to be a human readable
  - In text files, bytes represent characters
  - The content is usually organized into lines
    - Different markers for the *end-of-line* are used (1 or 2 bytes)
  - There can be a special marker for the *end-of-file* (Ctrl-Z)  
*It is from CP/M and later used in DOS. It is not widely used in Unix like systems.*
  - For parsing text files, we can use
    - Character oriented functions – `putchar()`, `getchar()`, `putc()`, `getc()`
    - Functions for formatted i/o – `printf()` and `scanf()` as shortcuts for the `fprintf()` and `fscanf()` with the `stdin` and `stdout` streams
    - Line oriented functions – `puts()`, `gets()` and variants `fputs()`, `fgets()`
- Text files can be considered as a sequence of bytes
  - Numeric values as text need to be parsed and formatted in writing
- Numbers in binary files may deal with byte ordering  
*E.g., ARM vs x86*

Jan Faigl, 2017 B3B36PRG – Lecture 06: I/O and Standard Library 4 / 50

## File Positioning

- Every stream has the cursor, i.e., an associated file position
- The position can be set using `offset` relatively to `whence`
- `int fseek(FILE *stream, long offset, int whence);`  
where `whence`
  - `SEEK_SET` – set the position from the beginning of file
  - `SEEK_CUR` – relatively to the current file position
  - `SEEK_END` – relatively to the end of file
- If the position is successfully set, `fseek()` returns 0
- `void rewind(FILE *stream);` sets the position to the beginning of file
- The position can be stored and set by the functions  
`int fgetpos(FILE * restrict stream, fpos_t * restrict pos);`  
`int fsetpos(FILE *stream, const fpos_t *pos);`

See `man fseek`, `man rewind`, etc

Jan Faigl, 2017 B3B36PRG – Lecture 06: I/O and Standard Library 8 / 50

## Overview of the Lecture

- Part 1 – Input and Output
  - File Operations
  - Character Oriented I/O
  - Text Files
  - Block Oriented I/O
  - Non-Blocking I/O
  - Terminal I/O
- Part 2 – Selected Standard Libraries
  - Standard library – Selected Functions
  - Error Handling

*K. N. King: chapters 22*

*K. N. King: chapters 21, 23, 24, 26, and 27*

Jan Faigl, 2017 B3B36PRG – Lecture 06: I/O and Standard Library 2 / 50

## File open

- Functions for input/output are defined in the standard library `<stdio.h>`
- The file access is through using a pointer to a file (stream) `FILE*`
- File can be opened using `fopen()`  
`FILE* fopen(const char * restrict path, const char * restrict mode);`  
*Notice, the restrict keyword*
- Operations with the files are
  - Stream oriented – sequential reading/writing
    - The **current position in the file is like a cursor**
    - At the opening the file, the cursor is set to the beginning of the file
  - The mode of the file operations is specified in the `mode` parameter
    - `"r"` – reading from the file  
*The program (user) needs to have sufficient rights for reading from the file.*
    - `"w"` – writing to the file  
*A new file is created if it does not exist; otherwise the content of the file is cleared.*
    - `"a"` – append to the file – the cursor is set to the end of the file
    - The modes can be combined, e.g., `"r+"` open the file for reading and writing

See `man fopen`

Jan Faigl, 2017 B3B36PRG – Lecture 06: I/O and Standard Library 6 / 50

## File Stream Modes

- Modes in the `fopen()` can be combined  
`FILE* fopen(const char * restrict path, const char * restrict mode);`
  - `"r"` open for reading
  - `"w"` Open for writing (file is created if it does not exist)
  - `"a"` open for appending (set cursor to the end of file or create a new file if it does not exist)
  - `"r+"` open for reading and writing (starts at beginning)
  - `"w+"` open for reading and writing (truncate if file exists)
  - `"a+"` open for reading and writing (append if file exists)
- There are restrictions for the combined modes with `"+"`
  - We cannot switch from reading to writing without calling a file-positioning function or reaching the end of file
  - We cannot switch from writing to reading without calling `fflush()` or calling a file-positioning function.

Jan Faigl, 2017 B3B36PRG – Lecture 06: I/O and Standard Library 9 / 50

# Part I Input and Output

Jan Faigl, 2017 B3B36PRG – Lecture 06: I/O and Standard Library 3 / 50

## `fopen()`, `fclose()`, and `feof()`

- Test the file has been opened

```
1 char *fname = "file.txt";
2
3 if ((f = fopen(fname, "r")) == NULL) {
4     fprintf(stderr, "Error: open file '%s'\n", fname);
5 }
```
- Close file – `int fclose(FILE *stream);`

```
1 if (fclose(f) == EOF) {
2     fprintf(stderr, "Error: close file '%s'\n", fname);
3 }
```
- Test of reaching the end-of-file (EOF) – `int feof(FILE *stream);`

Jan Faigl, 2017 B3B36PRG – Lecture 06: I/O and Standard Library 7 / 50

## Temporary Files

- `FILE* tmpfile(void);` – creates a temporary file that exists until it is closed or the program exists
- `char* tmpnam(char *s);` – generates a name for a temporary file
  - If `s` is `NULL`, it creates a name and store it in a static variable and return a pointer to it
  - Otherwise it copies the string into the provided character array (`s`) and returns the pointer to the first character of the array

Jan Faigl, 2017 B3B36PRG – Lecture 06: I/O and Standard Library 10 / 50

## File Buffering

- `int fflush(FILE *stream);` – flushes buffer for the given `stream`
  - `fflush(NULL);` – flushes all buffers (all output streams)
- Change the buffering mode, size, and location of the buffer
 

```
int setvbuf(FILE * restrict stream, char * restrict buf,
int mode, size_t size);
```

 The `mode` can be one of the following macros
  - `_IOFBF` – full buffering. Data are read from the stream when buffer is empty and written to the stream when it is full
  - `_IOLBF` – line buffering. Data are read or written from/to the stream one line at a time
  - `_IONBF` – no buffer. Direct reading and writing without buffer

```
#define BUFFER_SIZE 512
char buffer[BUFFER_SIZE];

setvbuf(stream, buffer, _IOFBF, BUFFER_SIZE);
```
- `void setvbuf(FILE * restrict stream, char * restrict buf);` – similar to `setvbuf()` but with default mode

Jan Faigl, 2017 B3B36PRG – Lecture 06: I/O and Standard Library 11 / 50

File Operations Character Oriented I/O Text Files Block Oriented I/O Non-Blocking I/O Terminal I/O

Example – Copy using `getc()` and `putc()` 1/2

- Simple copy program based on reading bytes from `stdin` and writing them to `stdout`

```
1 int c;
2 int bytes = 0;
3 while ((c = getc(stdin)) != EOF) {
4     if (putc(c, stdout) == EOF) {
5         fprintf(stderr, "Error in putc");
6         break;
7     }
8     bytes += 1;
9 }
```

lec06/copy-getc\_putc.c

Jan Faigl, 2017 B3B36PRG – Lecture 06: I/O and Standard Library 15 / 50

File Operations Character Oriented I/O Text Files Block Oriented I/O Non-Blocking I/O Terminal I/O

Formatted I/O – `fscanf()`

- `int fscanf(FILE *file, const char *format, ...);`
- It return number of read items, e.g., for the input
 

```
record 1 13.4
```
- The statement `int r = fscanf(f, "%s %d %lf\n", str, &i, &d);`
- sets (in the case of success) the variable `r` to the value 3
 

```
r == 3
```
- For reading strings, it is necessary to respect the size of the allocated memory, e.g., by using the limited length of the read string
 

```
char str[10];
int r = fscanf(f, "%9s %d %lf\n", str, &i, &d);
```

lec06/file\_scanf.c

Jan Faigl, 2017 B3B36PRG – Lecture 06: I/O and Standard Library 19 / 50

## Detecting End-of-File and Error Conditions

- Three possible errors can occur during reading data (e.g., `fscanf()`)
  - End-of-file – we reach the end of file
    - Or, the stream is closed, e.g., `stdin`
  - Read error – the read function is unable to read data from the stream
  - Matching failure – the read data does not match the requested format
- Each stream (`FILE*`) has two indicators:
  - error indicator – indicates that a read or write error occurs
  - end-of-file indicator – is set when the end of file is reached
- The indicators can be read (tested if the indicator is set or not) and clear the error and eof indicators
  - `int ferror(FILE *stream);`
  - `void clearerr(FILE *stream);`
  - `int feof(FILE *stream);`

Jan Faigl, 2017 B3B36PRG – Lecture 06: I/O and Standard Library 12 / 50

File Operations Character Oriented I/O Text Files Block Oriented I/O Non-Blocking I/O Terminal I/O

Example – Copy using `getc()` and `putc()` 2/2

- We can count the number of bytes and need time to copy the bytes
 

```
1 #include <sys/time.h>
2 ...
3
4 struct timeval t1, t2;
5 gettimeofday(&t1, NULL);
6
7 ... // copy the stdin -> stdout
8
9 gettimeofday(&t2, NULL);
10 double dt = t2.tv_sec - t1.tv_sec + ((t2.tv_usec - t1.tv_usec) / 1000000.0);
11 double mb = bytes / (1024 * 1024);
12 fprintf(stderr, "%.2lf MB/sec\n", mb / dt);
```
- Example of creating random file and using the program
 

```
clang -O2 copy-getc_putc.c
dd bs=512m count=1 if=/dev/random of=/tmp/rand1.dat
1+0 records in
1+0 records out
536870912 bytes transferred in 7.897227 secs (67982205 bytes/sec)
./a.out < /tmp/rand1.dat >/tmp/rand2.dat
326.10 MB/sec
```

Jan Faigl, 2017 B3B36PRG – Lecture 06: I/O and Standard Library 16 / 50

File Operations Character Oriented I/O Text Files Block Oriented I/O Non-Blocking I/O Terminal I/O

Formatted I/O – `fprintf()`

- `int fprintf(FILE *file, const *format, ...);`

```
int main(int argc, char *argv[])
{
    char *fname = argc > 1 ? argv[1] : "out.txt";
    FILE *f;
    if ((f = fopen(fname, "w")) == NULL) {
        fprintf(stderr, "Error: Open file '%s'\n", fname);
        return -1;
    }
    fprintf(f, "Program arguments argc: %d\n", argc);
    for (int i = 0; i < argc; ++i) {
        fprintf(f, "argv[%d]='%s'\n", i, argv[i]);
    }
    if (fclose(f) == EOF) {
        fprintf(stderr, "Error: Close file '%s'\n", fname);
        return -1;
    }
    return 0;
}
```

lec06/file\_printf.c

Jan Faigl, 2017 B3B36PRG – Lecture 06: I/O and Standard Library 20 / 50

## Reading and Writing Single Byte

- Basic function for reading from `stdin` and `stdout` are
  - `getc()` and `putc()`
  - Both function return `int` value, to indicate an error (`EOF`)
  - The written and read values are converted to `unsigned char`
- The variants of the function for the specific stream are
  - `int getc(FILE *stream);` and `int putc(int c, FILE *stream);`
  - `getc()` is equivalent to `getc(stdin)`
  - `putc()` is equivalent to `putc()` with the `stdout` stream
- Reading byte-by-byte (unsigned char) can be also used to read binary data, e.g., to construct 4 bytes length `int` from the four byte (`char`) values

Jan Faigl, 2017 B3B36PRG – Lecture 06: I/O and Standard Library 14 / 50

File Operations Character Oriented I/O Text Files Block Oriented I/O Non-Blocking I/O Terminal I/O

## Line Oriented I/O

- A whole (text) line get be read by

```
char* gets(char *str);
char* fgets(char * restrict str, int size, FILE * restrict stream);
```

- `gets()` cannot be used securely due to lack of bounds checking
- A line can be written by `fputs()` an `puts()`
- `puts()` write the given string and a `newline character` to the `stdout` stream
- `puts()` and `fputs()` return a non-negative integer on success and `EOF` on error

See man fgets, man fputs

Jan Faigl, 2017 B3B36PRG – Lecture 06: I/O and Standard Library 18 / 50

File Operations Character Oriented I/O Text Files Block Oriented I/O Non-Blocking I/O Terminal I/O

## Block Read/Write

- We can use `fread()` and `fwrite()` to read/write a block of data

```
size_t fread(void * restrict ptr,
size_t size, size_t nmemb,
FILE * restrict stream);

size_t fwrite(const void * restrict ptr,
size_t size, size_t nmemb,
FILE * restrict stream);
```

Use `const` to indicate (`ptr`) is used only for reading

Jan Faigl, 2017 B3B36PRG – Lecture 06: I/O and Standard Library 22 / 50

## Block Read/Write – Example 1/4

- Program to read/write a given (as `#define BSIZE`) number of `int` values using `#define BUFSIZE` length buffer
- Writing is enabled by the optional program argument `-w`
- File for reading/writing is a mandatory program argument

```
1 #include <stdio.h>          17 int main(int argc, char *argv[])
2 #include <string.h>        18 {
3 #include <errno.h>         19     int c = 0;
4 #include <assert.h>        20     _Bool read = true;
5 #include <stdbool.h>       21     const char *fname = NULL;
6 #include <stdlib.h>        22     FILE *file;
7                             23     const char *mode = "r";
8 #include <sys/time.h>     24     while (argc-- > 1) {
9                             25         fprintf(stderr, "DEBUG: argc: %d '%s'\n", argc, argv[argc]);
10                            26         if (strcmp(argv[argc], "-w") == 0) {
11 #ifndef BUFSIZE           27             fprintf(stderr, "DEBUG: enable writing\n");
12 #define BUFSIZE 32768    28             read = false; // enable writing
13 #endif                   29             mode = "w";
14 #ifndef BSIZE            30         } else {
15 #define BSIZE 4098      31             fname = argv[argc];
16 #endif                   32         }
                            33     } // end while
                            34
                            35
                            36
                            37
                            38
                            39
                            40
                            41
                            42
                            43
                            44
                            45
                            46
                            47
                            48
                            49
                            50
                            51
                            52
                            53
                            54
                            55
                            56
                            57
                            58
                            59
                            60
                            61
                            62
                            63
                            64
                            65
                            66
                            67
                            68
                            69
                            70
                            71
                            72
                            73
                            74
                            75
                            76
                            77
                            78
                            79
                            80
                            81
                            82
                            83
                            84
                            85
                            86
                            87
                            88
                            89
                            90
                            91
                            92
                            93
                            94
                            95
                            96
                            97
                            98
                            99
le06/demo-block_io.c
```

Jan Faigl, 2017 B3B36PRG – Lecture 06: I/O and Standard Library 23 / 50

## Block Read/Write – Example 4/4

- Increased write buffer `BUFSIZE` (128 MB) improves writing performance

```
clang -DBSIZE=100000000 -DBUFSIZE=134217728 demo-block_io.c && ./a.out -w aa 2>&1 | grep INFO
INFO: Write to the file 'aa'
INFO: write 381 MB
INFO: 325.51 MB/sec
```

- But does not improve reading performance, which relies on the standard size of the buffer

```
clang -DBSIZE=100000000 -DBUFSIZE=134217728 demo-block_io.c && ./a.out aa 2>&1 | grep INFO
INFO: Read from the file 'aa'
INFO: read 381 MB
INFO: 1693.39 MB/sec
```

Jan Faigl, 2017 B3B36PRG – Lecture 06: I/O and Standard Library 26 / 50

## Key Press without Enter

- Reading character from `stdin` can be made by the `getchar()` function
- However, the input is buffered to read line, i.e., it is necessary to press Enter key by default
- We can avoid that by setting the terminal to a `raw` mode

```
#include <stdio.h>
#include <ctype.h>
int c;
while ((c = getchar()) != 'q') {
    if (isalpha(c)) {
        printf("Key '%c' is alphabetic;", c);
    } else if (isspace(c)) {
        printf("Key '%c' is space character;", c);
    } else if (isdigit(c)) {
        printf("Key '%c' is decimal digit;", c);
    } else if (isblank(c)) {
        printf("Key is blank;");
    } else {
        printf("Key is something else;");
    }
    printf(" ascii: %s\n",
           isascii(c) ? "true" : "false");
}
return 0;
```

le06/demo-getchar.c

Jan Faigl, 2017 B3B36PRG – Lecture 06: I/O and Standard Library 31 / 50

## Block Read/Write – Example 2/4

```
34 file = fopen(fname, mode);
35 if (!file) {
36     fprintf(stderr, "ERROR: Cannot open file '%s', error %d - %s\n", fname, errno, strerror(errno));
37     return -1;
38 }
39 int *data = (int*)malloc(BSIZE * sizeof(int));
40 assert(data);
41 struct timeval t1, t2;
42 gettimeofday(&t1, NULL);
43 if (read) {
44     fprintf(stderr, "INFO: Read from the file '%s'\n", fname);
45     c = fread(data, sizeof(int), BSIZE, file);
46     if (c != BSIZE) {
47         fprintf(stderr, "WARN: Read only %i objects (int)\n", c);
48     } else {
49         fprintf(stderr, "DEBUG: Read %i objects (int)\n", c);
50     }
51 } else {
52     /* WRITE FILE */
53     char buffer[BUFSIZE];
54     if (setvbuf(file, buffer, _IOFBF, BUFSIZE)) { /* SET BUFFER */
55         fprintf(stderr, "WARN: Cannot set buffer");
56     }
57     fprintf(stderr, "INFO: Write to the file '%s'\n", fname);
58     c = fwrite(data, sizeof(int), BSIZE, file);
59     if (c != BSIZE) {
60         fprintf(stderr, "WARN: Write only %i objects (int)\n", c);
61     } else {
62         fprintf(stderr, "DEBUG: Write %i objects (int)\n", c);
63     }
64     fflush(file);
65     gettimeofday(&t2, NULL);
66     double dt = t2.tv_sec - t1.tv_sec + ((t2.tv_usec - t1.tv_usec) / 1000000.0);
67     double mb = (sizeof(int) * c) / (1024 * 1024);
68     fprintf(stderr, "DEBUG: feof: %i feof: %i feof: %i\n", feof(file), feof(file), feof(file));
69     fprintf(stderr, "INFO: %s %i MB\n", (read ? "read" : "write"), sizeof(int)*BSIZE/(1024 * 1024));
70     fprintf(stderr, "INFO: %.21f MB/sec\n", mb / dt);
71     free(data);
72     return EXIT_SUCCESS;
73 }
```

Jan Faigl, 2017 B3B36PRG – Lecture 06: I/O and Standard Library 24 / 50

## Blocking and Non-Blocking I/O Operations

- Usually I/O operations are considered as **blocking requested**
  - System call does not return control to the application until the requested I/O is completed
  - It is motivated that we need all the requested data and I/O operations are usually slower than the other parts of the program.
    - We have to wait for the data anyway*
  - It is also called **synchronous** programming
- Non-Blocking** system calls do not wait for unrelated I/O to complete, and thus do not block the application
  - It is suitable for network programming, multiple clients, graphical user interface, or when we need to avoid “deadlock” or too long waiting due to slow or not reliable communication
  - Call for reading requested data will read (and “return”) only data that are actually available in the input buffer
- Asynchronous** programming with **non-blocking** calls
  - Return control to the application immediately
  - Data are transferred to/from buffer “on the background”
    - Call back, triggering a signal, etc.*

Jan Faigl, 2017 B3B36PRG – Lecture 06: I/O and Standard Library 28 / 50

## Key Press without Enter – Example

- We can switch the `stdin` to the `raw` mode using `termios`

```
void call_termios(int reset)
{
    static struct termios tio, tioOld;
    tcgetattr(STDIN_FILENO, &tio);
    if (reset) {
        tcsetattr(STDIN_FILENO, TCSANOW, &tioOld);
    } else {
        tioOld = tio; //backup
        cfmakeraw(&tio);
        tcsetattr(STDIN_FILENO, TCSANOW, &tio);
    }
}
```

- Or we can use the `stty` tool
- Usage `clang demo-getchar.c -o demo-getchar`
  - Standard “Enter” mode: `./demo-getchar`
  - Raw mode using `termios`: `./demo-getchar termios`
  - Raw mode using `stty`: `./demo-getchar stty`

le06/demo-getchar.c

Jan Faigl, 2017 B3B36PRG – Lecture 06: I/O and Standard Library 32 / 50

## Block Read/Write – Example 3/4

```
66 double dt = t2.tv_sec - t1.tv_sec + ((t2.tv_usec - t1.tv_usec) / 1000000.0);
67 double mb = (sizeof(int) * c) / (1024 * 1024);
68 fprintf(stderr, "DEBUG: feof: %i feof: %i feof: %i\n", feof(file), feof(file), feof(file));
69 fprintf(stderr, "INFO: %s %i MB\n", (read ? "read" : "write"), sizeof(int)*BSIZE/(1024 * 1024));
70 fprintf(stderr, "INFO: %.21f MB/sec\n", mb / dt);
71 free(data);
72 return EXIT_SUCCESS;
73 }
```

- Default `BUFSIZE` (32 kB) to write/read  $10^8$  integer values (~480 MB)

```
clang -DBSIZE=100000000 demo-block_io.c && ./a.out -w a 2>&1 | grep INFO
INFO: Write to the file 'a'
INFO: write 381 MB
INFO: 10.78 MB/sec
```

```
./a.out a 2>&1 | grep INFO
INFO: Read from the file 'a'
INFO: read 381 MB
INFO: 1683.03 MB/sec
```

- Try to read more elements results in `feof()`, but not in `ferror()`

```
clang -DBSIZE=200000000 demo-block_io.c && ./a.out a
DEBUG: argc: 1 'a'
INFO: Read from the file 'a'
WARN: Read only 100000000 objects (int)
DEBUG: feof: 1 feof: 0
INFO: read 762 MB
INFO: 1623.18 MB/sec
```

le06/demo-block\_io.c

Jan Faigl, 2017 B3B36PRG – Lecture 06: I/O and Standard Library 25 / 50

## Non-Blocking I/O Operations – Example

- Setting the file stream (file descriptor) to the `O_NONBLOCK` mode
    - Also for socket descriptor*
  - For reading from regular files it does not too much sense to use non-blocking operations
  - Reading from block devices such as serial port, e.g., `/dev/ttyS10` may be more suitable
    - We can set `O_NONBLOCK` flag for a file descriptor using `fcntl()`
- ```
#include <fcntl.h> // POSIX
// open file by the open() system call that return a file descriptor
int fd = open("/dev/ttyUSB0", O_RDWR, S_IRUSR | S_IWUSR);
// read the current settings first
int flags = fcntl(fd, F_GETFL);
// then, set the O_NONBLOCK flag
fcntl(fd, F_SETFL, flags | O_NONBLOCK);
```
- Then, calling `read()` will provide the requested number of bytes are fewer bytes that are currently available in the buffer

Jan Faigl, 2017 B3B36PRG – Lecture 06: I/O and Standard Library 29 / 50

## Part II

## Selected Standard Libraries

Jan Faigl, 2017 B3B36PRG – Lecture 06: I/O and Standard Library 31 / 50

Jan Faigl, 2017 B3B36PRG – Lecture 06: I/O and Standard Library 33 / 50

## Standard Library

- The C programming language itself does not provide operations for input/output, more complex mathematical operations, nor:
    - string operations
    - dynamic allocation
    - run-time error handling
  - These and further functions are included in the standard library that is a part of the C compiler
    - Library – the compiled code is linked to the program, e.g., `libc.so`  
*Viz e.g., `ldd a.out`*
    - Header files contain function prototypes, types, macros, etc.
- [<assert.h>](#)   [<inttypes.h>](#)   [<signal.h>](#)   [<stdlib.h>](#)  
[<complex.h>](#)   [<iso646.h>](#)   [<stdarg.h>](#)   [<string.h>](#)  
[<ctype.h>](#)   [<limits.h>](#)   [<stdbool.h>](#)   [<tgmath.h>](#)  
[<errno.h>](#)   [<locale.h>](#)   [<stddef.h>](#)   [<time.h>](#)  
[<fenv.h>](#)   [<math.h>](#)   [<stdint.h>](#)   [<wchar.h>](#)  
[<float.h>](#)   [<setjmp.h>](#)   [<stdio.h>](#)   [<wctype.h>](#)

B3B36PRG – Lecture 06: I/O and Standard Library

35 / 50

Standard library – Selected Functions

Error Handling

## Mathematical Functions

- [<math.h>](#) – basic function for computing with “real” numbers
  - Root and power of floating point number `x`  
`double sqrt(double x); float sqrtf(float x);`
  - `double pow(double x, double y);` – power
  - `double atan2(double y, double x);` –  $\arctan y/x$  with quadrand determination
  - Symbolic constants – `M_PI`, `M_PI_2`, `M_PI_4`, etc.
    - `#define M_PI 3.14159265358979323846`
    - `#define M_PI_2 1.57079632679489661923`
    - `#define M_PI_4 0.78539816339744830962`
  - `isfinite()`, `isnan()`, `isless()`, ... – comparison of “real” numbers
  - `round()`, `ceil()`, `floor()` – rounding and assignment to integer
- [<complex.h>](#) – function for complex numbers *ISO C99*
- [<fenv.h>](#) – function for control rounding and representation according to IEEE 754.  
[man math](#)

B3B36PRG – Lecture 06: I/O and Standard Library

38 / 50

Standard library – Selected Functions

Error Handling

## Error handling

- Basic error codes are defined in [<errno.h>](#)
- These codes are used in standard library as indicators that are set in the global variable `errno` in a case of an error during the function call, e.g.,
  - If file open `fopen()` fails, it returns `NULL`, which does not provide the cause of the failure
- The cause of failure can be stored in the `errno` variable
- Text description of the numeric error codes are defined in [<string.h>](#)
  - String can be obtain by the function  
`char* strerror(int errnum);`

Jan Faigl, 2017

B3B36PRG – Lecture 06: I/O and Standard Library

42 / 50

## Standard library – Overview

- [<stdio.h>](#) – Input and output (including formatted)
  - [<stdlib.h>](#) – Math function, dynamic memory allocation, conversion of strings to number.
    - Sorting – `qsort()`
    - Searching – `bsearch()`
    - Random numbers – `rand()`
  - [<limits.h>](#) – Ranges of numeric types
  - [<math.h>](#) – Math functions
  - [<errno.h>](#) – Definition of the error values
  - [<assert.h>](#) – Handling runtime errors
- [<ctype.h>](#) – character classification, e.g., see [lec06/demo-getchar.c](#)  
 ■ [<string.h>](#) – Strings and memory transfers, i.e., `memcpy()`  
 ■ [<locale.h>](#) – Internationalization  
 ■ [<time.h>](#) – Date and time

Jan Faigl, 2017

B3B36PRG – Lecture 06: I/O and Standard Library

36 / 50

Standard library – Selected Functions

Error Handling

## Variable Arguments &lt;stdarg.h&gt;

- It allows to write a function with a variable number of arguments  
*Similarly as in the functions `printf()` and `scanf()`*
- The header file [<stdarg.h>](#) defines
  - Type `va_list` and macros
  - `void va_start(va_list ap, parmN);` – initiate `va_list`
  - `type va_arg(va_list ap, type);` – fetch next variable
  - `void va_end(va_list ap);` – cleanup before function return
  - `void va_copy(va_list dest, va_list src);`  
*`va_copy()` has been introduced in C99*
- We have to pass the number of arguments to the functions with variable number of arguments

Jan Faigl, 2017

B3B36PRG – Lecture 06: I/O and Standard Library

39 / 50

Standard library – Selected Functions

Error Handling

## Example – errno

- File open
 

```

1 #include <stdio.h>
2 #include <errno.h>
3 #include <string.h>
4
5 int main(int argc, char *argv[]) {
6     FILE *f = fopen("soubor.txt", "r");
7     if (f == NULL) {
8         int r = errno;
9         printf("Open file failed errno value %d\n", errno);
10        printf("String error '%s'\n", strerror(r));
11    }
12    return 0;
13 }
```

[lec06/errno.c](#)
- Program output if the file does not exist  
Open file failed errno value 2  
String error 'No such file or directory'
- Program output for an attempt to open a file without having sufficient access rights  
Open file failed errno value 13  
String error 'Permission denied'

Error Handling

## Example – Variable Arguments &lt;stdarg.h&gt;

```

1 #include <stdio.h>
2 #include <stdarg.h>
3
4 int even_numbers(int n, ...);
5 int main(void)
6 {
7     printf("Number of even numbers: %i\n", even_numbers(2, 1, 2));
8     printf("Number of even numbers: %i\n", even_numbers(4, 1, 3, 4, 5));
9     printf("Number of even numbers: %i\n", even_numbers(3, 2, 4, 6));
10    }
11 }
12
13 int even_numbers(int n, ...)
14 {
15     int c = 0;
16     va_list ap;
17     va_start(ap, n);
18     for (int i = 0; i < n; ++i) {
19         int v = va_arg(ap, int);
20         (v % 2 == 0) ? c += 1 : 0;
21     }
22     va_end(ap);
23     return c;
24 }
```

40 / 50

Standard library – Selected Functions

Error Handling

## Testing macro assert()

- We can add tests for particular value of the variables, for debugging
- Such test can be made by the macro `assert(expr)` from [<assert.h>](#)
- IF `expr` is not logical 1 (`true`) the program is terminated and the particular line and the name of the source file is printed
- Macro includes particular code to the program  
*It provides a relatively straightforward way to evaluate and indicate possible errors, e.g., due to a wrong function argument.*
- We can disable the macro by definition of the macro `NDEBUG`  
[man assert](#)
- Example
 

```

#include <stdio.h>
#include <assert.h>

int main(int argc, char *argv[])
{
    assert(argc > 1);
    printf("program argc: %d\n", argc);
    return 0;
}
```

[lec06/assert.c](#)

44 / 50

Standard library – Selected Functions

Error Handling

## Example of assert() Usage

- Compile the program the `assert()` macro and executing the program with/without program argument

```
clang assert.c -o assert
./assert
Assertion failed: (argc > 1), function main, file assert.c
, line 5.
zsh: abort      ./assert
./assert 2
start argc: 2
```

- Compile the program without the macro and executing it with/without program argument

```
clang -DNDEBUG assert.c -o assert
./assert
program start argc: 1
./assert 2
program start argc: 2
```

B3B36PRG – Lecture 06: I/O and Standard Library

48 / 50

## Long Jumps

- The `goto` statement can be used only within a function
- `<setjmp.h>` defines function `setjmp()` and `longjmp()` for jumps across functions
- `setjmp()` stores the actual state of the registers and if the function return non-zero value, the function `longjmp()` has been called
- During `longjmp()` call, the values of the registers are restored and the program continues the execution from the location of the `setjmp()` call

*We can use `setjmp()` and `longjmp()` to implement handling exceptional states similarly as `try-catch`*

```
1 #include <setjmp.h>          12 int compute(int x, int y) {
2 jmp_buf jb;                13     if (y == 0) {
3 int compute(int x, int y);  14         longjmp(jb, 1);
4 void error_handler(void);   15     } else {
5 if (setjmp(jb) == 0) {      16         x = (x + y * 2);
6     r = compute(x, y);      17         return (x / y);
7     return 0;               18     }
8 } else {                    19 }
9     error_handler();        20 void error_handler(void) {
10    return -1;               21     printf("Error\n");
11 }                             22 }
```

B3B36PRG – Lecture 06: I/O and Standard Library

46 / 50

Topics Discussed

## Summary of the Lecture

## Communication with the Environment – <stdlib.h>

- The header file `<stdlib.h>` defines standard program return values `EXIT_FAILURE` and `EXIT_SUCCESS`
- A value of the environment variable get be retrieved by the `getenv()`

```
1 #include <stdio.h>
2 #include <stdlib.h>
3
4 int main(void)
5 {
6     printf("USER: %s\n", getenv("USER"));
7     printf("HOME: %s\n", getenv("HOME"));
8     return EXIT_SUCCESS;
9 }
```

lec06/demo-getenv.c

- `void exit(int status)`; – the program is terminated as it will be by calling `return(status)` in the `main()` function.
- We can register a function that will be called at the program exit by the `int atexit(void (*func)(void))`;
- The program can be aborted by calling `void abort(void)`, in this case, registered functions by the `atexit()` are not called
