#### What is Understood as Robot?

Rossum's Universal Robots (R.U.R)

Cyberdyne T-800

Industrial robots

NS-5 (Sonny) Artificial Intelligence (AI) is probably most typical understand as intelligent robot

# Intelligent Robots

- React to the environment sensing
- Adapt to the current conditions
- Make decision and new goals

E.g., in robotic exploration

- Even though they are autonomous systems, the behaviour is relatively well defined
- Adaptation and ability to solve complex problems are implemented as algorithms and techniques of Artificial Intelligence

In addition to mechanical and electronical design, robot control, sensing, etc.

**Robots and Robotics** 

Stacionary vs Mobile Robots

Stationary (industrial) robots

address the problem of **navigation** 

Challenges in Robotics

Robots can be categorized into two main groups

Stationary robots – defined (limited) working space

planning tasks can be a challenging problem

■ Mobile robots – it can move, and therefore, it is necessary to

What is a Robot? Locomotion

Mobile robots

Locomotion

### Stationary Robots

 Conventional robots needs separated and human inaccessible working space because of safety reasons

 Cooperating robots share the working space with humans

Jan Faigl, 2017	B4M36UIR – Lectur	re 01: Introduction to Robotics	25 / 52	Jan Faigl, 2017	B4M36UIR – Lectur	e 01: Introduction to Robotics	26 / 52
Robots and Robotics	Challenges in Robotics	What is a Robot?	Locomotion	Robots and Robotics	Challenges in Robotics	What is a Robot?	Locomotion

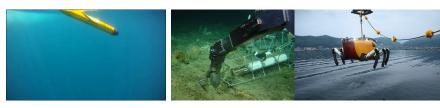

## Types of Mobile Robots

Regarding the environment: ground, underground, aerial, surface, and underwater vehicles

Even stationary robots need an efficient motion, and thus motion

Based on the locomotion: wheeled, tracked, legged, modular

## Challenges in Robotics

- Autonomous vehicles cars, delivers, etc
- Consumable robots toys, vacuum cleaner, lawn mover, pool cleaner
- Robotic companions
- Search and rescue missions
- Extraterrestrial exploration
- Robotic Surgery
- Multi-robot coordination

In addition to other technological challenges, new efficient AI algorithms have to be developed to address the nowadays and future challenges

Robots and Robotics

Challenges in Robotics

What is a Robot? Locomotion **Robots and Robotics** 

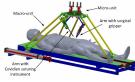

Locomotion

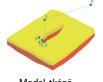

## **Robotic Surgery**

- Evolution of Laparoscopic Surgery Complex operations with shorter postoperative recovery
- Precise robotic manipulators and teleoperated surgical robotic systems
- Further step is automation of a surgical procedures

One of the main main challenges is planning and navigation in tissue

Challenges in Robo

Surgical droid 2-1B

Jan Faigl, 2017 Robots and Robotics

# Robotics in B4M36UIR

- Fundamental problems related to motion planning and mission planning with mobile robots
- The discussed motion planning methods are general and applicable also into other domains and different robotic platforms including stationary robotic arms
- Robotics is interdisciplinary field
  - Electrical, mechanical, control, and computer engineering
  - **Computer science** such as machine learning, artificial intelligence, computational intelligence, machine perception, etc.
  - Human-Robot interaction and cognitive robotics is also related to psychology, brain-robot interfaces to Neuroscience, robotic surgery to medicine, etc.

In B4M36UIR, we will touch a small portion of the whole field, mostly related to motion planning and mission planning that can be "encapsulated" as robotic information gathering

# Artificial Intelligence and Robotics

- Artificial Intelligence (AI) field originates in 1956 with the summary that a intelligent machine needs:
  - Internal models of the world
  - Search through possible solutions
  - Planning and reasoning to solve problems
  - Symbolic representation of information
  - Hierarchical system organization
  - Sequential program execution M. Mataric, Robotic Primer
  - Al-inspired robot Shakey

Artificial Intelligence laboratory of Stanford Research Institute (1966-1972)

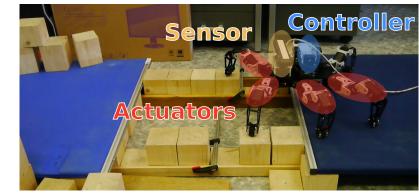

Shakey – perception, geometrical map building, planning, and acting – early Al-inspired robotics purely deliberative control

# What is a Robot?

A robot is an autonomous system which exists in the physical world, can sense its environment, and can act on it to achieve some goals

- The robot has a physical body in the physical world embodiment
- The robot has sensors and it can sense/perceive its environment
- A robot has effectors and actuators it can act in the environment
- A robot has controller which allows it to be autonomous

Jan Faigl, 2017

- Properties of gaits are: stability, speed, energy efficiency, robustness (how the gait can recover from some failures), simplicity (how complex is to generate the gait)
- A typical gait for hexapod walking robot is tripod which is stable as all the times at least three legs are on the ground

Gullan et al., The Insects: An outline of entomology, 2005

Jan Faigl, 2017

entomology, 2005 lida et al., Science Direct, 63, 2008 B4M36UIR – Lecture 01: Introduction to Robotics swing phases

 $\beta = T_{Stance} / T_{Stride}$ 

• The movement is a coordination of the stance and swing phases

A stride is a combination of the leg movement with the foot tip on the ground (during the stance phase) and the leg movement in a particular direction (in the swing phase) within one gait cycle
 Various gaits can be created by different sequences of stance and

•  $T_{Stance}$ ,  $T_{Swing}$ ,  $T_{Stride} = T_{Stance} + T_{Swing}$  defines the duty factor

of the legs defined by the gait, e.g., tripod

Tibia

Triod  $\beta = 0.5$

Locomotion

# Central Pattern Generator (CPG)

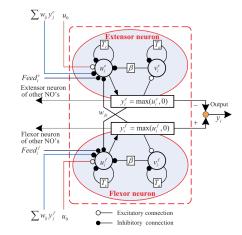

- Central Pattern Generators (CPGs) are neural circuits to produce rhythmic patterns for various activities, i.e., locomotor rhythms to control a periodic movement of a particular body parts
- Salamander CPG with 20 amplitude-controlled phase oscillators

Auke Jan Ijspeert, Neural Networks, 2008

## Example of Rhythmic Pattern Oscillator

- One of the widely used oscillators is the Matsuoka oscillator model
- It is based on biological concepts of the extensor and flexor muscles
- The rhythmic patterns defined the trajectory of the leg end point (foot tip)
- The coordinates of the foot tip can be utilized to computed the joint angles using the Inverse Kinematics

Matsuoka, K. (1985). Sustained oscillations generated by mutually inhibiting neurons with adaptation. Biological Cybernetics 52,  $367{-}376$ 

An example of simple CPG to control hexapod walking robot will be addressed during the labs

Topics	Discussed

#### **Topics Discussed**

- Information about the Course
- Overview of robots, robotics, and challenges
  - Robot Embodied software agent
  - Sensor, Controller, Actuators
  - Degrees of Freedom (DOF) and Controllable DOF
  - Mobile Robot Locomotion
  - Locomotion Gaits for Legged Robots
  - Central Pattern Generator

#### Next: Robotic Paradigms and Control Architectures
