Notation

Robotic Planning Context

A classical motion planning problem

Having a CAD model of the piano, model of the environment, the problem is how to move the piano from one place to another without hitting anything.

Basic motion planning algorithms are focused primarily on rotations and translations.

- We need notion of model representations and formal definition of the problem.
- Moreover, we also need a context about the problem and realistic assumptions.

Notation

The plans have to be admissible and feasible.

Jan Faigl, 2017 Introduction to Path Planning B4M36UIR - Lecture 03: Path and Motion Planning Path Planning Methods

Real Mobile Robots

In a real deployment, the problem is a more complex.

- The world is changing
- Robots update the knowledge about the environment

localization, mapping and navigation

- New decisions have to made
- A feedback from the environment Motion planning is a part of the mission replanning loop.

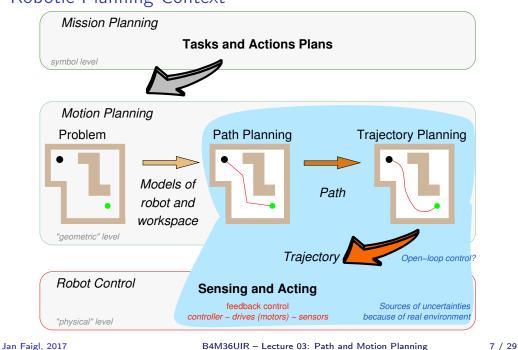

Josef Štrunc, Bachelor thesis, CTU, 2009.

An example of robotic mission:

Multi-robot exploration of unknown environment

How to deal with real-world complexity?

Relaxing constraints and considering realistic assumptions.

 \mathbf{W} – World model describes the robot workspace and its boundary determines the obstacles \mathcal{O}_i .

Notation

2D world. $\mathcal{W} = \mathbb{R}^2$

Path Planning Methods

- A **Robot** is defined by its geometry, parameters (kinematics) and it is controllable by the motion plan.
- $\square C$ Configuration space (*C*-space)

A concept to describe possible configurations of the robot. The robot's configuration completely specify the robot location in ${\cal W}$ including specification of all degrees of freedom.

E.g., a robot with rigid body in a plane $C = \{x, y, \varphi\} = \mathbb{R}^2 \times S^1$.

- Let \mathcal{A} be a subset of \mathcal{W} occupied by the robot, $\mathcal{A} = \mathcal{A}(q)$.
- A subset of C occupied by obstacles is

$$\mathcal{C}_{obs} = \{ q \in \mathcal{C} : \mathcal{A}(q) \cap \mathcal{O}_i, orall i \}$$

Collision-free configurations are

$$\mathcal{C}_{free} = \mathcal{C} \setminus \mathcal{C}_{obs}.$$

Introduction to Path Planning

Planning in C-space

Notation

Path Planning Methods

Path / Motion Planning Problem

Path is a continuous mapping in C-space such that $\pi: [0,1] \to \mathcal{C}_{free}$, with $\pi(0) = q_0$, and $\pi(1) = q_f$,

Only geometric considerations

Trajectory is a path with explicate parametrization of time, e.g., accompanied by a description of the motion laws ($\gamma : [0,1] \rightarrow \mathcal{U}$, where \mathcal{U} is robot's action space).

It includes dynamics.

 $[T_0, T_f] \ni t \rightsquigarrow \tau \in [0, 1] : q(t) = \pi(\tau) \in \mathcal{C}_{free}$

The planning problem is determination of the function $\pi(\cdot)$.

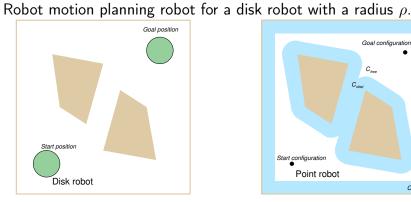

Additional requirements can be given:

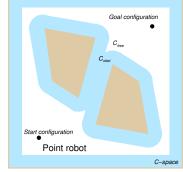

- Smoothness of the path
- Kinodynamic constraints

Optimality criterion

E.g., considering friction forces

shortest vs fastest (length vs curvature)

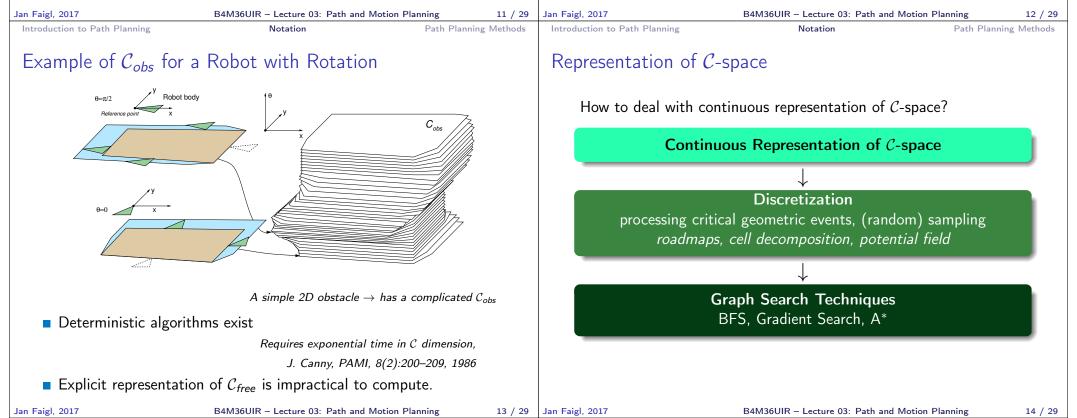

Motion planning problem in geometrical representation of \mathcal{W}

C-space has been obtained by enlarging obstacles by the disk Awith the radius ρ .

By applying Minkowski sum: $\mathcal{O} \oplus \mathcal{A} = \{x + y \mid x \in \mathcal{O}, y \in \mathcal{A}\}.$

Cell Decomposition

1. Decompose free space into parts.

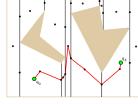

Any two points in a convex region can be directly connected by a segment.

- 2. Create an adjacency graph representing the connectivity of the free space.
- 3. Find a path in the graph.

Trapezoidal decomposition

Centroids represent cells

Connect adjacency cells

Other decomposition (e.g., triangulation) are possible.

Find path in the adjacency graph single-point query

A similar structure can be found for two-point query, e.g., H. Guo, A. Maheshwari, J.-R. Sack, 2008

Precompute all shortest paths from map vertices to p_g using

• Then, an estimation of the shortest path from p to p_g is the

The estimation can be further improve by "ray-shooting" technique combined with walking in triangulation (convex partitioning)

Point Location Problem

For a given partitioning of the polygonal domain into a discrete set of cells, determine the cell for a given point p

Masato Edahiro, Iwao Kokubo and Takao Asano: A new point-location algorithm and its practical efficiency: comparison with existing algorithms, ACM Trans. Graph., 3(2):86-109, 1984.

■ It can be implemented using interval trees – slabs and slices

Point location problem, SPM and similarly problems are from the Computational Geometry field

B4M36UIR - Lecture 03: Path and Motion Planning

B4M36UIR - Lecture 03: Path and Motion Planning

(Faigl, 2010) 23 / 29

goal location p_g for a polygonal domain \mathcal{P} with *n* vertices A partitioning of the free space into cells with respect to the particular location p_{g}

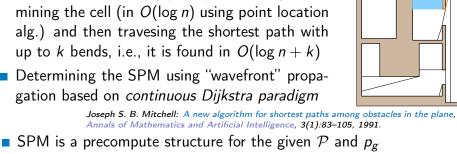

• Each cell has a vertex on the shortest path to p_{g}

Speedup computation of the shortest path towards a particular

- Shortest path from any point *p* is found by determining the cell (in $O(\log n)$ using point location alg.) and then travesing the shortest path with up to k bends, i.e., it is found in $O(\log n + k)$
- Determining the SPM using "wavefront" propagation based on continuous Dijkstra paradigm

Approximate Shortest Path and Navigation Mesh

shortest path among the one of the cell vertex

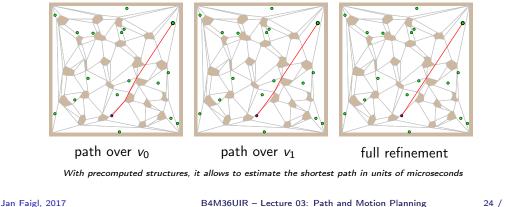

Introduction to Path Planning

Notation

Path Planning Methods

Path Refinement

- Testing collision of the point p with particular vertices of the estimation of the shortest path
 - Let the initial path estimation from p to pg be a sequence of k vertices (p, v1,..., vk, pg)
 - We can iteratively test if the segment (p, v_i), 1 < i ≤ k is collision free up to (p, p_g)

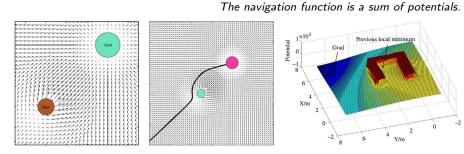

Artificial Potential Field Method

Introduction to Path F

Jan Faigl, 2017

- The idea is to create a function f that will provide a direction towards the goal for any configuration of the robot.
- Such a function is called navigation function and $-\nabla f(q)$ points to the goal.
- Create a potential field that will attract robot towards the goal q_f while obstacles will generate repulsive potential repelling the robot away from the obstacles.

Such a potential function can have several local minima.

B4M36UIR – Lecture 03: Path and Motion Planning

26 / 29 Jan Faigl, 2017

B4M36UIR - Lecture 03: Path and Motion Planning

27 / 29

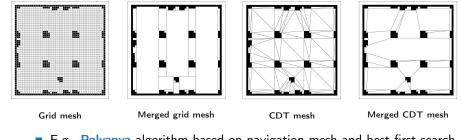

Navigation Mesh

 In addition to robotic approaches, fast shortest path queries are studied in computer games

Notation

- There is a class of algorithms based on navigation mesh
 - A supporting structure representing the free space

It usually originated from the grid based maps, but it is represented as **CDT – Constrained Delaunay triangulation**

 E.g., Polyanya algorithm based on navigation mesh and best-first search M. Cui, D. Harabor, A. Grastien: Compromise-free Pathfinding on a Navigation Mesh, IJCAI 2017, 496-502. https://bitbucket.org/dharabor/pathfinding
