Optimal Maneuvers for Dubins Vehicle

■ CSC type: LSL, LSR, RSL, RSR;

■ The optimal paths are called **Dubins maneuvers**: • Constant velocity: v(t) = v and turning radius ρ

Dubins Vehicle and Dubins Planning

Part I

Part 1 - Data Collection Planning - Aerial

Surveillance Missions

L. E. Dubins (1957) - American Journal of Mathematics

Dubins Vehicle and Dubins Planning

as one of two main types

■ CCC type: LRL, RLR;

■ For two states $q_1 \in SE(2)$ and $q_2 \in SE(2)$ in the environment

without obstacles $\mathcal{W} = \mathbb{R}^2$ the optimal paths can be characterized

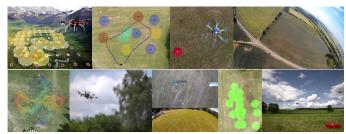

where S - straight line arc, C - circular arc oriented to left (L) or

6 types of trajectories connecting any configuration in $\mathbb{R}^2 \times \mathbb{S}^1$, i.e.,

■ The control *u* is according to *C* and *S* type one of the three possible

Motivation - Surveillance Missions with Aerial Vehicles

■ Provide curvature-constrained path to collect the most valuable measurements with shortest possible path/time or under limited travel budget

- Formulated as routing problems with Dubins vehicle
 - Dubins Traveling Salesman Problem with Neighborhoods
 - Dubins Orienteering Problem with Neighborhoods

Dubins Vehicle and Dubins Planning

B4M36UIR - Lecture 09: Data Collection with Dubins Vehicles

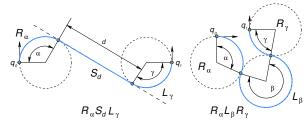

Parametrization of Dubins Maneuvers

■ Parametrization of each trajectory phase:

$$\{L_{\alpha}R_{\beta}L_{\gamma}, R_{\alpha}L_{\beta}R_{\gamma}, L_{\alpha}S_{d}L_{\gamma}, L_{\alpha}S_{d}R_{\gamma}, R_{\alpha}S_{d}L_{\gamma}, R_{\alpha}S_{d}R_{\gamma}\}$$

for $\alpha \in [0, 2\pi), \beta \in (\pi, 2\pi), d \ge 0$

Notice the prescribed orientation at q0 and qf

Dubins Vehicle

- Non-holonomic vehicle such as car-like or aircraft can be modeled as the Dubins vehicle
 - Constant forward velocity
 - Limited minimal turning radius ρ
 - Vehicle state is represented by a triplet $q = (x, y, \theta)$, where
 - $(x,y) \in \mathbb{R}^2$, $\theta \in \mathbb{S}^2$ and thus, $q \in SE(2)$

The vehicle motion can be described by the equation:

$$\left[\begin{array}{c} \dot{x} \\ \dot{y} \\ \dot{\theta} \end{array} \right] = v \left[\begin{array}{c} \cos \theta \\ \sin \theta \\ \frac{u}{\rho} \end{array} \right], \quad |u| \leq 1,$$

where u is the control input

B4M36UIR - Lecture 09: Data Collection with Dubins Vehicles Dubins Vehicle and Dubins Planning

Dubins Vehicle and Dubins Planning

values $u \in \{-1, 0, 1\}$

 $\sin \theta$

Planning with Dubins vehicle

- The optimal path connecting two configurations can be found analytically E.g., for UAVs that usually operates in environment without obstacles
- The Dubins maneuvers can also be used in randomized-sampling based motion planners, such as RRT, in the control based sampling
- Dubins vehicle model can be considered in the multi-goal path planning
 - Surveillance, inspection or monitoring missions to periodically visits given target locations (areas)
- Dubins Touring Problem DTP

Given a sequence of locations, what is the shortest path visting the locations, i.e., what are headings of the vehicle at the locations.

■ Dubins Traveling Salesman Problem DTSP

Given a set of locations, what is the shortest Dubins path that visits each location exactly once and returns to the origin location.

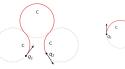

■ Dubins Orienteering Problem

Given a set of locations, each with associated reward, what is the Dubins path visiting the most rewarding locations and not exceeding given travel budget.

Dubins Planning

right (R)

- Minimal turning radius ρ
- Constant forward velocity v
- State of the Dubins vehicle is $q = (x, y, \theta)$, $q \in SE(2), (x, y) \in \mathbb{R}^2 \text{ and } \theta \in \mathbb{S}^1$

- Optimal path connecting $q_1 \in SE(2)$ and $q_2 \in SE(2)$ consists only of straight line arcs and arcs with the maximal curvature, i.e., two types of maneuvers CCC and CSC
- The solution can be found analytically

(Dubins, 1957)

given sequence of waypoints

The main difficulty is to determine the vehicle headings for the

Jan Faigl, 2017

Dubins Touring Problem - DTP

■ For a sequence of the *n* waypoint locations $P=(p_1,\ldots p_n),\ p_i\in\mathbb{R}^2$, the Dubins Touring Problem (DTP) stands to determine the optimal headings $T = \{\theta_1, \dots, \theta_n\}$ at the waypoints q_i such that

minimize
$$_T$$
 $\mathcal{L}(T,P) = \sum_{i=1}^{n-1} \mathcal{L}(q_i,q_{i+1}) + \mathcal{L}(q_n,q_1)$ subject to $q_i = (p_i,\theta_i), \ \theta_i \in [0,2\pi), \ p_i \in P,$

where $\mathcal{L}(q_i,q_i)$ is the length of the optimal Dubins maneuver connecting q_i with

- The DTP is a continuous optimization problem
- The term $\mathcal{L}(q_n, q_1)$ is for the possibly closed tour that can be for example reguested in the TSP with Dubins vehicle, a.k.a. DTSP

On the other, when the DTP can also be utilized for open paths such as solutions of the OP with Dubins vehicle

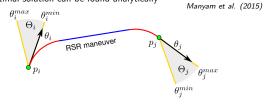

B4M36UIR - Lecture 09: Data Collection with Dubins Vehicles

■ In some cases, it may be suitable to relaxed the heading at the first/last locations in finding closed tours (i.e., solving DTSP)

Dubins	Vehicle	and	Dubins	Planning	L) I P	 ISP	D	15

Dubins Interval Problem (DIP)

- Dubins Interval Problem (DIP) is a generalization of Dubins maneuvers to the shortest path connecting two points p_i and p_i
- In the DIP, an leaving interval Θ_i at p_i and arrival interval Θ_i at p_i are
- The optimal solution can be found analytically

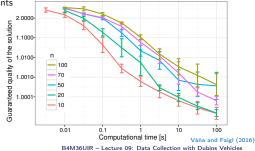

- Solution of the DIP is a tight lower bound for the DTP
- Solution of the DIP is not a feasible solution of the DTP Notice, for $\Theta_i = \Theta_i = \langle 0, 2\pi \rangle$ the optimal maneuver for DIP is straight

B4M36UIR - Lecture 09: Data Collection with Dubins Vehicles

The DIP-based Sampling of Headings in the DTP

- A similar forward search graph as for the DTP can be used for heading intervals instead of particular headings
- Using DIP for a sequence of waypoints is a lower bound of the DTP
- It can be used to inform how to splitting heading intervals
- The ratio between the lower bound and feasible solution of the DTP provides estimation of the solution quality, e.g. for problems with nwaypoints

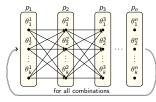

Sampling-based Solution of the DTP

■ For a closed sequence of the waypoint locations

$$P=(p_1,\ldots,p_n)$$

 We can sample possible heading values at each location i into a discrete set of k headings, i.e., $\Theta^i = \{\theta^i_1, \dots, \theta^i_k\}$ and create a graph of all possible Dubins maneuvers

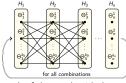

- For a set of heading samples, the optimal solution can be found by a forward search of the graph in O(nk³) For open sequence we do not need to evalute all possible initial headings, and the complexity is $O(nk^2)$
- The key is to determined the most suitable heading samples per each waypoint

B4M36UIR - Lecture 09: Data Collection with Dubins Vehicles

Lower Bound of the DTP

■ For a discrete set of heading intervals $\mathcal{H} = \{H_1, \dots, H_n\}$, where $H_i = \{\Theta_i^1, \Theta_i^2, \dots, \Theta_i^{k_i}\}$, a similar graph as for the DTP can be constructed with edge cost determined by the solution of the associated DIP

■ The forward search of the graph with dense samples provides a tight lower bound of the DTP

Manyam and Rathinam, 2015

B4M36UIR - Lecture 09: Data Collection with Dubins Vehicles

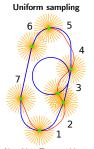

Informed Sampling of Headings in Solution of the DTP

- Iterative refinement of the heading intervals \mathcal{H} up to the angular resolution ϵ_{reg} The angular resolution is gradually decreased for promising intervals
- refineDTP divide the intervals of the lower bound solution
- solveDTP solve DTP using the heading from the refined intervals

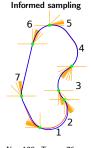

■ It simultaneously provides feasible and lower bound solution of the DTP

■ First solution is provided very quickly – any-time algorithm

Example of Heading Sampling - Uniform vs. Informed

 $N = 128, T_{cpu} = 76 \text{ ms}$ $\mathcal{L} = 14.4, \ \mathcal{L}_{II} = 14.2,$

- N is the total number of samples, i.e., 32 samples per waypoint for uniform sampling
- **L** is the length of the tour (blue) and \mathcal{L}_U is the lower bound (red) determined as a solution of the **Dubins Interval Problem (DIP)**

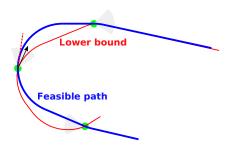

Dubins Vehicle and Dubins Planning DTP DTSP DTSPN DOP

B4M36UIR - Lecture 09: Data Collection with Dubins Vehicles

Lower Bound and Feasible Solution of the DTP

■ The arrival and departure angles may not be the same

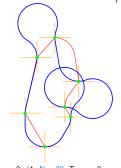

The lower bound solution is not a feasible solution of the DTP

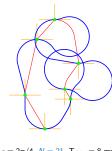

■ DTP solution – use any particular heading of each interval in the lower bound solution

B4M36UIR - Lecture 09: Data Collection with Dubins Vehicles

Uniform vs Informed Sampling

 $\epsilon = 2\pi/4$, N = 28, $T_{CPU} = 8$ ms $\mathcal{L} = 27.9, \, \mathcal{L}_{II} = 13.2$

 $\epsilon = 2\pi/4$, N = 21, $T_{CPU} = 8$ ms $\mathcal{L} = 29.9, \, \mathcal{L}_{IJ} = 13.2$

B4M36UIR - Lecture 09: Data Collection with Dubins Vehicles

Results and Comparison with Uniform Sampling

- Random instances of the DTSP with sequence determined as a solution of the Euclidean TSP
- The waypoints placed in a squared bounding box with the side $s=(\rho\sqrt{n})/d$ for the $\rho=1$ and density d=0.5

- \blacksquare Informed sampling-based approach provides solutions up to 0.01% from the optima
- Solution of the DTP is a fundamental bulding block for routing problems with
 Dubins vehicle

Decoupled Solution of the DTSP – Alternating Algorithm

Alternating Algorithm (AA) provides a solution of the DTSP for an even number of targets n

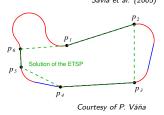

Savla et al. (2005)

Solve the related Euclidean TSP

Jan Faigl, 2017

Relaxed motion constraints

- Establish headings for even edges using straight line segments
- 3. Determine optimal maneuvers for odd edges

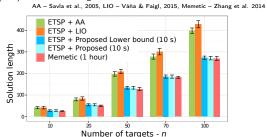

B4M36UIR - Lecture 09: Data Collection with Dubins Vehicles 25 / 58 Jana Dubins Planning DTP DTSP DTSPN DOP DOPN Planning in 3D

DTP Solver in Solution of the DTSP

■ The solution of the DTP can be used to solve DTSP for the given sequence of the waypoints

E.g., determined as a solution of the Euclidean TSP as in the Alternating Algorithm

Comparision with the Algorithm Algorithm (AA), Local Interative Algorithm (LIO) and Memetic algorithm

Dubins Traveling Salesman Problem (DTSP)

- 1. Determine a closed shortest Dubins path visiting each location $p_i \in P$ of the given set of n locations $P = \{p_1, \dots, p_n\}, \ p_i \in \mathbb{R}^2$
- 2. Permutation $\Sigma = (\sigma_1, \dots, \sigma_n)$ of visits

 Sequencing part of the problem
- 3. Headings $\Theta = \{\theta_{\sigma_1}, \theta_{\sigma_2}, \dots, \theta_{\sigma_n}\}$ for $p_{\sigma_i} \in P$ Continuous optimization
- DTSP is an optimization problem over all possible permutations Σ and headings Θ in the states $(q_{\sigma_1}, q_{\sigma_2}, \dots, q_{\sigma_n})$ such that $q_{\sigma_i} = (p_{\sigma_i}, \theta_{\sigma_i})$

minimize
$$\Sigma_{,\Theta}$$

$$\sum_{i=1}^{n-1} \mathcal{L}(q_{\sigma_i}, q_{\sigma_{i+1}}) + \mathcal{L}(q_{\sigma_n}, q_{\sigma_1}) \quad (1)$$
subject to $q_i = (p_i, \theta_i) \ i = 1, \dots, n,$ (2)

where $\mathcal{L}(q_{\sigma_i},q_{\sigma_j})$ is the length of Dubins path between q_{σ_i} and q_{σ_j}

aigl, 2017 B4M36UIR - Lecture 09: Data Collection with Dubins Vehicles 2

DTSP with the Given Sequence of the Visits to the Targets

If the sequence of the visits Σ to the target locations is given

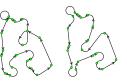

- the problem is to determine the optimal heading at each location
- the problem is to determine the optimal heading at each location
- We call the problem as the Dubins Touring Problem (DTP)

 Váña and Faiel (2016)
- Let for each location $g_i \in G$ sample possible heading to k values, i.e., for each g_i the set of headings be $h_i = \{\theta_1^1, \dots, \theta_k^k\}$.
- \blacksquare Since Σ is given, we can construct a graph connecting two consecutive locations in the sequence by all possible headings
- For such a graph and particular headings $\{h_1, \ldots, h_n\}$, we can find an optimal headings and thus, the optimal solution of the DTP.

Challenges of the Dubins Traveling Salesman Problem

- The key difficulty of the DTSP is that the path length mutually depends on
- Order of the visits to the locations
 - Headings at the target locations

We need the sequence to determine headings, but headings may influence the sequence

Two fundamental approaches can be found in literature

- Decoupled approach based on a given sequence of the locations
 - E.g., found by a solution of the Euclidean TSP
- Sampling-based approach with sampling the headings at the locations into discrete sets of values and considering the problem as the variant of the Generalized TSP

Besides, further approaches are

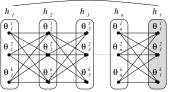

- Approximation algorithms; optimal solutions for restricted variants
- Genetic and memetic techniques (evolutionary algorithms)
- Unsupervised learning based approaches

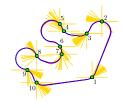

aigl, 2017 B4M36UIR – Lecture 09: Data Collection with Dubins Vehicles

Vehicles 24 / 5

DTSP as a Solution of the DTP

The first layer is duplicated layer to support the forward search method

- The edge cost corresponds to the length of Dubins maneuver
- Better solution of the DTP can be found for more samples, which will also improve the DTSP but only for the given sequence

Two questions arise for a practical solution of the DTP

- How to sample the headings? Since more samples makes finding solution more demanding
 - We need to sample the headings in a "smart" way.
- What is the solution quality? Is there a tight lower bound?

aigl, 2017 B4M36UIR - Lecture 09: Data Collection with Dubins Vehicles 27 / 58 pins Vehicle and Dubins Planning DTP DTSP DTSPN DOP DOPN Planning in 3D

Dubins Traveling Salesman Problem with Neighborhoods In surveillance planning, it may be required to visit a set of target

- regions $\mathbf{G} = \{R_1, \dots, R_n\}$ by the Dubins vehicle
- Then, for each target region R_i , we have to determine a particular point of the visit $p_i \in R_i$ and DTSP becomes the Dubins Traveling Salesman Problem with Neighborhoods (DTSPN)

In addition to Σ and headings Θ , waypoint locations P have to be determined

■ DTSPN is an optimization problem over all permutations Σ , headings $\Theta = \{\theta_{\sigma_1}, \dots, \theta_{\sigma_n}\}$ and points $P = (p_{\sigma_1}, \dots, p_{\sigma_n})$ for the states $(q_{\sigma_1}, \dots, q_{\sigma_n})$ such that $q_{\sigma_i} = (p_{\sigma_i}, \theta_{\sigma_i})$ and $p_{\sigma_i} \in R_{\sigma_i}$:

minimize
$$\sum_{i=1}^{n-1} \mathcal{L}(q_{\sigma_i}, q_{\sigma_{i+1}}) + \mathcal{L}(q_{\sigma_n}, q_{\sigma_1})$$
 (3

subject to $q_i = (p_i, \theta_i), p_i \in R_i \ i = 1, \dots, n$

• $\mathcal{L}(q_{\sigma_i}, q_{\sigma_j})$ is the length of the shortest possible Dubins maneuver connecting the states q_{σ_i} and q_{σ_i}

DTSP - Sampling-based Approach

 Sampled heading values can be directly utilized to find the sequence as a solution of the Generalized Traveling Salesman Problem (GTSP)

Notice For Dubins vehicle, it is the Generalized Asymmetric TSP (GATSP)

The problem is to determine a shortest tour in a graph that visits all specified subsets of the graph's vertices.

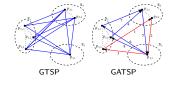

The TSP is a special case of the GTSP when each subset to be visited consists just a single vertex.

 $\blacksquare \mathsf{GATSP} \to \mathsf{ATSP}$

Noon and Bean (1991)

■ ATSP can be solved by LKH

 \blacksquare ATSP \to TSP, which can be solved optimally, e.g., by Concorde

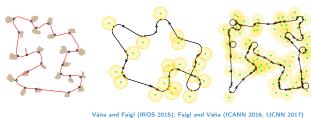

l, 2017 B4M36UIR – Lecture 09: Data Collection with Dubins Vehicles

DTSPN – Approches and Examples of Solution

- Similarly to the DTSP, also DTSPN can be addressed by
 - Decoupled approaches for which a sequence of visits to the regions can be found as a solution of the ETSP(N)
 - Sampling-based approaches and transformation to the GTSP ■ Clusters of sampled waypoint locations each with sampled possible
 - Soft-computing techniques such as, memetic algorithms
 - Unsupervised learning techniques

Jan Faigl, 2017

B4M36UIR - Lecture 09: Data Collection with Dubins Vehicles DTSP DTSPN DOP DOPN

Data Collection / Surveillance Planning with Travel Budget

- Visit the most important targets because of limited travel budget
- The problem can be formulated as the Orienteering Problem with Dubins vehicle, a.k.a. Dubins Orienteering Problem (DOP) Robert Pěnička, Jan Faigl, Petr Váňa and Martin Saska, RA-L 2017

B4M36UIR - Lecture 09: Data Collection with Dubins Vehicles DOP

Variable Neighborhood Search (VNS) for the DOP

- The solution is the first k locations of the sequence of all target locations satisfying T_{max} VNS for the OP - Sevkli, Z. et al. (2006)
- It is an improving heuristics, i.e., an initial solution has to be provied
- A set of predefined neighborhoods are explored to fiend a better solution
- Shake explores the configuration space and Insert escape from a local minima using
 - Insert moves one random element
 - Exchange exchanges two random elements
- Local Search optimizes the solution

sub-sequence

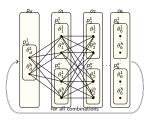

- Path insert moves a random sub-sequence ■ Path exchange – exchanges two random
- **Randomized VNS** examines only n^2 changes in the *Local Search* procedure in each iteration

 $S_1 \rightarrow S_6 \rightarrow S_4 \rightarrow S_2 \rightarrow S_5 \rightarrow S_3 \rightarrow$ Exchange

Path insert $S_1 \rightarrow S_5 \rightarrow S_3 \rightarrow S_6 \rightarrow S_4 \rightarrow S_7 \rightarrow S_2 \rightarrow S_{10}$ Path exchange

DTSPN - Decoupled Approach

- 1. Determine a sequence of visits to the n target regions as the solution of the ETSP
- 2. Sample possible waypoint locations and for each such a location sample possible heading values, e.g., s locations per each region and h heading per each locations
- 3. Construct a search graph and determine a solution in $O(n(sh)^3)$
- 4. Example of the search graph for n = 6, s = 6, and h = 6

B4M36UIR - Lecture 09: Data Collection with Dubins Vehicles

Dubins Orienteering Problem

- Curvature-constrained data collection path respecting Dubins vehicle model with the minimal turning radius ρ and constant forward velocity v
- The path is a sequence of wavpoints $a_i \in SE(2)$, $a = (s, \theta)$, $\theta \in \mathbb{S}^1$
- In addition to S_k , k, Σ (OP) determine headings $\Theta = (\theta_{\sigma_1}, \dots, \theta_{\sigma_k})$ such that

maximize subject to

The problem combines discrete combinatorial optimization (OP) with the continuous optimization for determining the vehicle headings

B4M36UIR - Lecture 09: Data Collection with Dubins Vehicles

Evolution of the VNS Solution to the DOP

 $\mathcal{L} = 79.7, R = 990$

Initial solution 4710th iteration 4790th iteration 5560th iteration (12th improvement) (16th improvement) (4th improvement) $T_{CPU} = 10.9 \text{ s},$ $T_{CPU} = 144.8 \text{ s},$

 $T_{CPU} = 147.3 \text{ s},$ $T_{CPU} = 170.0 \text{ s},$ $\mathcal{L} = 79.3, R = 1008$ $\mathcal{L} = 79.1, R = 1050$

DTSPN - Local Iterative Optimization (LIO)

- Instead of sampling into discrete set of waypoint locations and possible headings, we can perform local optimization using hill-climbing technique
- At each waypoint location p_i , the heading $\Theta_i \in [0, 2\pi)$
- **Each** waypoint location p_i can be parametrized as a point on the bounday of the respective region R_i , i.e., as a parameter $\alpha \in [0,1)$ measuring a normalized distance on the boundary of R_i
- The multi-variable optimization is treated independenly for each particular variable θ_i and α_i iteratively

Algorithm 2: Local Iterative Optimization (LIO) for the DTSPN Data: Input sequence of the regions $\mathbf{R} = (R_{\sigma_1}, \dots, R_{\sigma_n})$, for the permutation Σ **Result**: Waypoints $(q_{\sigma_1}, \dots, q_n)$, $q_i = (p_i, \theta_i)$, $p_i \in \delta R_i$ initialization() // random assignment of $q_i \in \delta R_i$; while global solution is improving do for every $R_i \in R$ do $\theta_i := \text{optimizeHeadingLocally}(\theta_i)$ $\alpha_i := \text{optimizePositionLocally}(\alpha_i);$ $q_i := \text{checkLocalMinima}(\alpha_i, \theta_i);$

Váňa and Faigl (IROS 2015)

B4M36UIR - Lecture 09: Data Collection with Dubins Vehicles Dubins Vehicle and Dubins Planning

Variable Neighborhood Search (VNS)

- Variable Neighborhood Search (VNS) is a general metaheuristic for combinatorial optimization (routing problems)
 - Hansen, P. and Mladenović, N. (2001): Variable neighborhood s pplications. European Journal of Operational Research.
- The VNS is based on shake and local search procedures
 - Shake procedure aims to escape from local optima by changing the solution within the neighborhoods $N_{1,...,k_{max}}$

The neighborhoods are particular operators

■ Local search procedure searches fully specific neighborhoods of the solution using I_{max} predefined operators

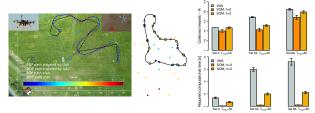

B4M36UIR - Lecture 09: Data Collection with Dubins Vehicles

Dubins Vehicle and Dubins Planning

Solution of the Dubins Orienteering Problem

- 1. Solve the Euclidean OP (EOP) and then determine Dubins path The final path may exceed the budget and the vehicle can miss the locations because
- 2. Directly solve the Dubins Orienteering Problem (DOP), e.g.,
 - Sample possible heading values and use Variable Neighborhood Search (VNS)
 - Unsupervised learning based on Self-Organizing Maps (SOM)

Faigl. (WSOM+ 2017)

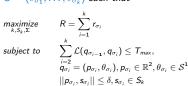

VNS-based approach provides better solutions than SOM, but it tends to be more computationally demanding

Dubins Orienteering Problem with Neighborhoods

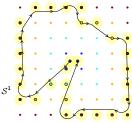

■ Curvature-constrained path respecting Dubins vehicle model

- Each waypoint consists of location $p \in \mathbb{R}^2$ and the heading $\theta \in \mathbb{S}^1$
- In addition to S_k , k, Σ determine locations

$$P_k = (p_{\sigma_1}, \dots, p_{\sigma_k})$$
 and headings $\Theta = (\theta_{\sigma_1}, \dots, \theta_{\sigma_k})$ such that

 $p_{\sigma_1} = s_1, p_{\sigma_k} = s_n$

We need to solve the continuous optimization for determining the vehicle heading at each waypoint and the waypoint locations $P_k = \{p_{\sigma_1}, \dots, p_{\sigma_k}\}, p_{\sigma_i} \in \mathbb{R}^2$

B4M36UIR - Lecture 09: Data Collection with Dubins Vehicles

3D Data Collection Planning with Dubins Airplane Model

■ Dubins Airplane model describes the vehicle state $q=(p,\theta,\psi), p\in\mathbb{R}^3$ and $\theta, \psi \in \mathbb{S}^1$ as

Chitsaz, H., LaValle, S.M. (2017)

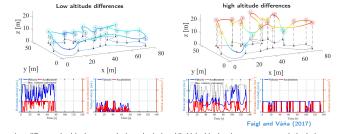

- Constant forward velocity v, the minimal turning radius ρ , and limited pitch angle, i.e., $\psi \in [\psi_{min}, \psi_{max}]$
- \mathbf{u}_{θ} is controls the vehicle heading, $|u_{\theta}| \leq 1$, and v is the forward velocity
- Generation of the 3D trajectory is based on the 2D Dubins maneuver
- If altitude changes are too high, additional helix segments are inserted

3D Surveillance Planning

- Parametrization of smooth 3D multi-goal trajectory a sequence of Bézier curves
- Unsupervised learning for the TSPN can be generalized for such trajectories
- During the solution of the sequencing, we can determine a velocity profile along the curve and compute the so-called Travel Time Estimation (TTE)
- It betters fits limits of the multi-rotor UAVs that are limited by maximal acceleration and velocities rather than minimal turning radius as for Dubins vehicle

Low differences in altitude saturate horizontal velocity while high altitudes changes saturate vertical velocity

B4M36UIR - Lecture 09: Data Collection with Dubins Vehicles

■ Path Exchange (I = 3).

of three operators and the particular I for the individual operators of the local search procedure are:

- One Point Exchange (l=3)

Pěnička, R., Faigl, J., Saska, M., Váňa, P. (2017)

Part II

Part 2 – Data Collection Planning for Surveillance Missions

Motivation and Assignment

Motivation

■ There is a framework for testing and evaluation of UAVs control strategy developed and maintained by the winners of the Mohamed Bin Zayed International Robotics Challenge (MBZIRC) 2017

> Multi-robot Systems (MRS) group http://mrs.felk.cvut.cz

- trajectories, i.e., Dubins trajectories, in simulator and real
- with multi-rotor unmanned aerial vehicles and practical deployment of the planned trajectories to UAVs
- Full support of the evaluation environment is provided together with setuped computers at the dedicated computer lab of MRS
- Practical deployment on real UAVs would be possible during the first campaigns in spring 2018

https://www.youtube.com/watch?v=ju3YbCtXpE

Motivation and Assignment

Assignment – HW03b

verify using real UAV

Topics: Data Collection Planning for Surveillance Missions Goal: Solve data collection planning problem formulated as the Dubins Traveling Salesman Problem (with Neighborhoods) and deploy the planned path to the model of UAVs and eventually experimentally

Assignment: https://cw.fel.cvut.cz/wiki/courses/b4m36uir/hw/hw03b

Up to additional 15 points can be gained for implementation solution of DTSP, DTSPN and execution of the trajectories in a MRS simulation framework

- Implement a solution of the DTSP, e.g., one of the following methods
 - (2 points) for simple ETSP and Alternating Algorithm (AA), a.k.a ETSP+AA;
 - (6 points) Become familiar with the MRS simulation framework and deploy the planned trajectories within the simulator
- Voluntary implementation of the DTSP and DTSPN sampling-based solvers
 - (4 points) ETSP+DTP (forward search graph) or GATSP→ATSP and solution
 - (3 points) Extension of the DTSP to DTSPN, e.g., forward search graph for DTP generalized for the DTRP or GATSP based approach

B4M36UIR - Lecture 09: Data Collection with Dubins Vehicles

Jan Faigl, 2017

Topics Discussed

Topics Discussed

- Dubins vehicles and planning Dubins maneuvers
- Dubins Interval Problem (DIP)
- Dubins Touring Problem (DTP)
- Dubins Traveling Salesman Problem (DTSP) and Dubins Traveling Salesman with Neighborhoods (DTSPN)
 - Decoupled approaches Alternating Algorithm
 - Sampling-based approaches GATSP
- Dubins Orienteering Problem (OP) and Dubins Orienteering Problem with Neighborhoods (DOPN)
- Data collection and surveillance planning in 3D
- Next: Multirobot Path Planning (MPP)

Summary of the Lecture

B4M36UIR - Lecture 09: Data Collection with Dubins Vehicles
