 - From conceptual models to ontologies
 - Ontologies for data integration

2

Semantic Web

- Linked Data
- Use-case: Open Data
- Semantic Web Adopters

One event or two events?

Just months before 9/11, the World Trade Center's lease was privatized and sold to Larry Silverstein.

Silverstein took out an insurance plan that 'fortuitously' covered terrorism.

After 9/11, Silverstein took the insurance company to court, claiming he should be paid double because there were 2 attacks.

Silverstein won, and was awarded \$4,550,000,000.

source:<https://www.metabunk.org/larry-silversteins-9-11-insurance.t2375>

What is an event ? How many events occurred at 9/11 – One or Two ?

Knowledge Management

9/11 ... matter of billions of USD

What is the trend of **Runway Incursion** incidents at an airline operator ?

Unauthorized entering the runway

Incorrect entering (without clearance) active runway

Civil Aviation Authority

What is a dataset about?

1

Sharing meaning of data

- Some examples of misunderstanding
- **What is a dataset about?**
- From conceptual models to ontologies
- Ontologies for data integration

2

Semantic Web

- Linked Data
- Use-case: Open Data
- Semantic Web Adopters

What is inside a dataset?

Energy-efficient buildings

| _id | building_name | ... |
|-----|---------------|-----|
| 3 | Atrium Flora | ... |
| ... | ... | ... |

Are there
bus stops
or
large stores
in this dataset?

See OpenData portal of Prague [OpenData portal of Prague](#)

What is a building?

Building is a construction

- both above and below ground
- spatially compact
- with walls and roof
- with heating

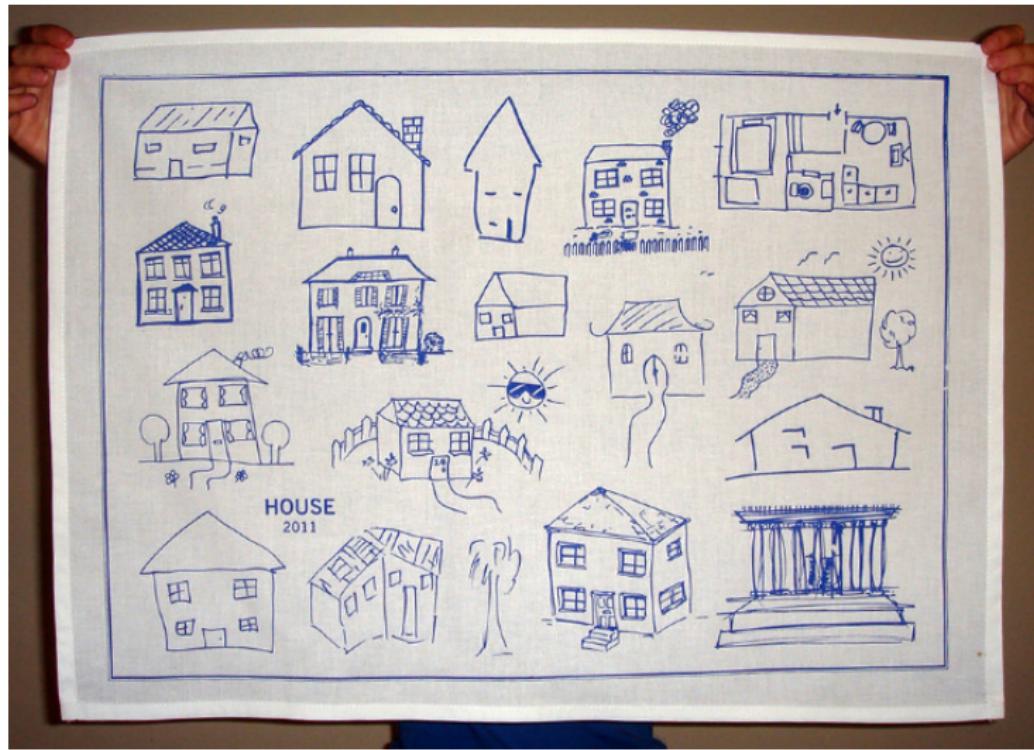

Act 406/2000 Coll., on
Energy Management

Building is a construction

- above ground
- with solid foundations
- spatially compact
- with walls and roof

Act 256/2013 Coll,
Cadastral Law

But things are even more complicated ...

What is a building?

1. ... is a **construction** which is **heated**.

2. ... is a **construction** to provide **protection** to their users or internal equipment and is typically **closed** and has a **permanent position**.

ČSN EN 15643-5 -Sustainability of construction works

Building

3. ... is a **construction above ground** which is **spatially-compact** and **closed by walls and roof**.

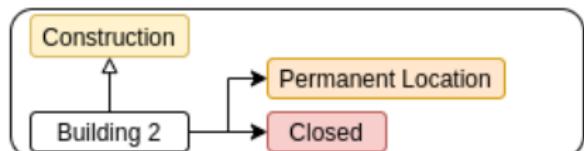

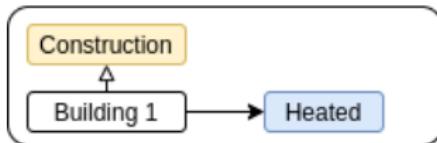

Act 256/2013 Coll., Cadastral Law

4. ... is a **construction above and below ground** which is **spatially-compact** and **closed by walls and roof** and is **heated or cooled**.

Act 406/2000 Coll., on Energy Management

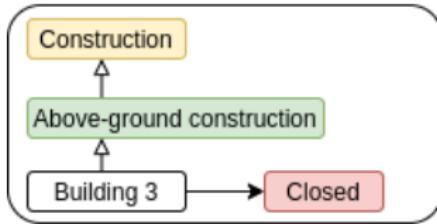

What is a building?

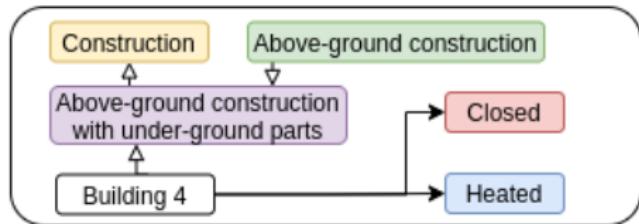

ČSN EN 15643-5 -Sustainability of construction works

Building

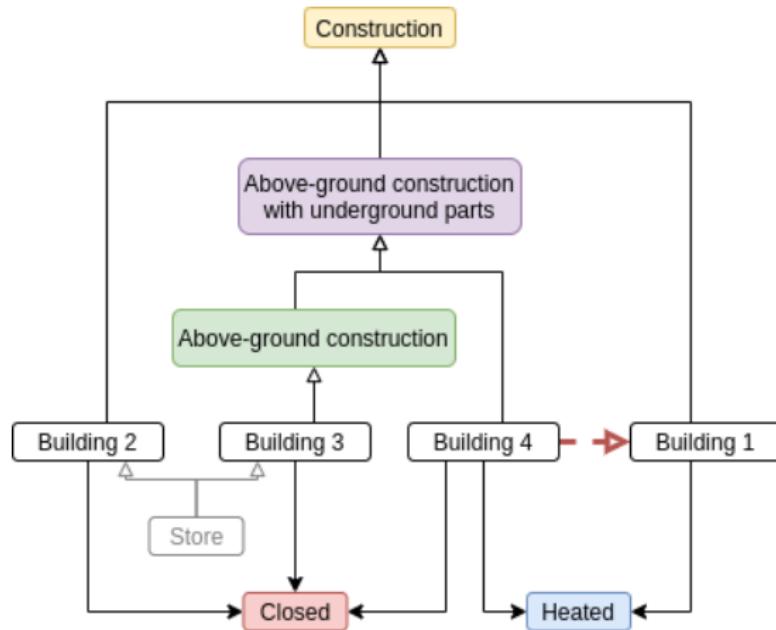

Act 256/2013 Coll., Cadastral Law

Act 406/2000 Coll., on Energy Management

New knowledge can be inferred

From conceptual models to ontologies

1

Sharing meaning of data

- Some examples of misunderstanding
- What is a dataset about?
- **From conceptual models to ontologies**
- Ontologies for data integration

2

Semantic Web

- Linked Data
- Use-case: Open Data
- Semantic Web Adopters

Ontological Conceptual Modeling

- a way to **capture** and **explain** meaning.
- the language must be understandable to non-experts (UML max)
- the language must be computable – we want to use the models to infer new knowledge or validate data

About ontologies

Ontologies

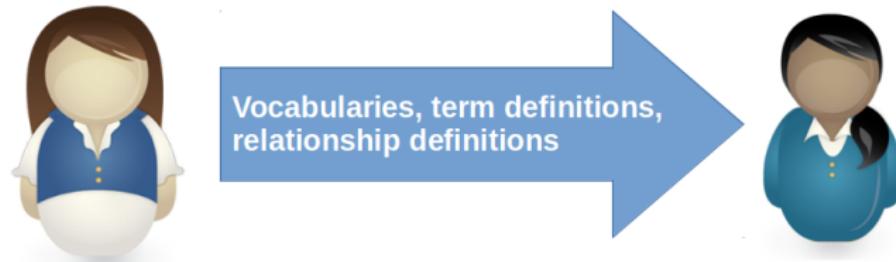

are **formal specifications of conceptualization**.

Ontologies help to stabilize the knowledge, to share meaning both among computers and among people. Use-cases include

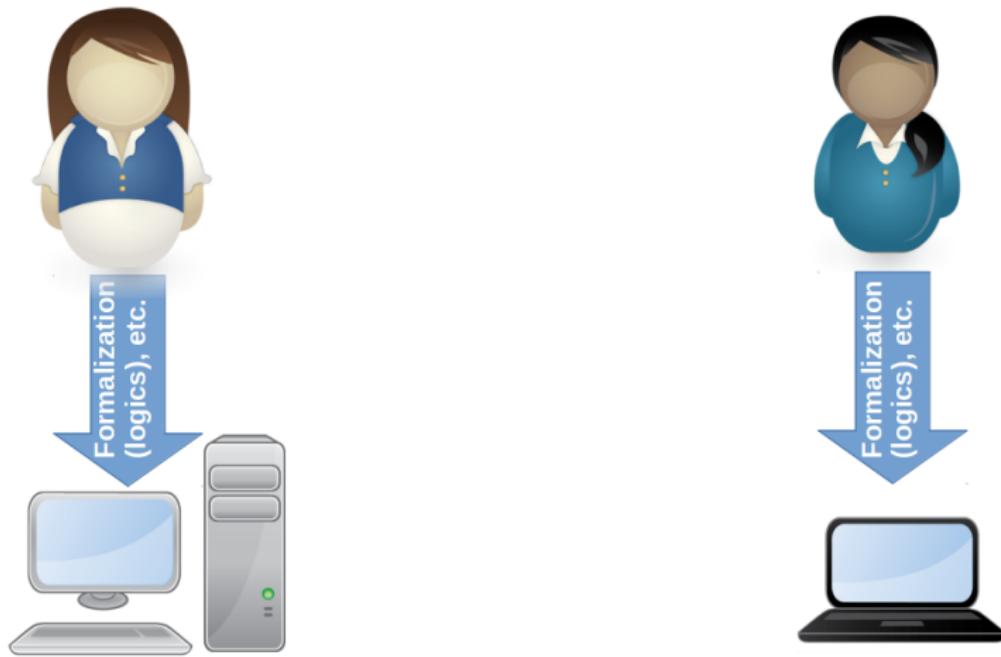

- Data Integration
- Semantic Web
- Open (Linked) Data

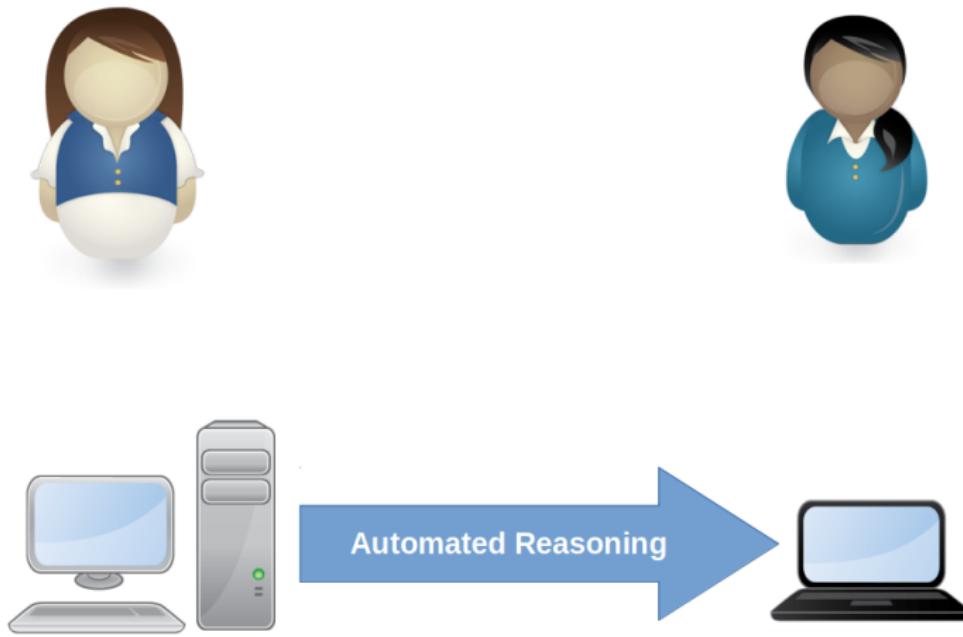

First, People Need to Understand Each Other

Second, People Need to Explain Things to Computers

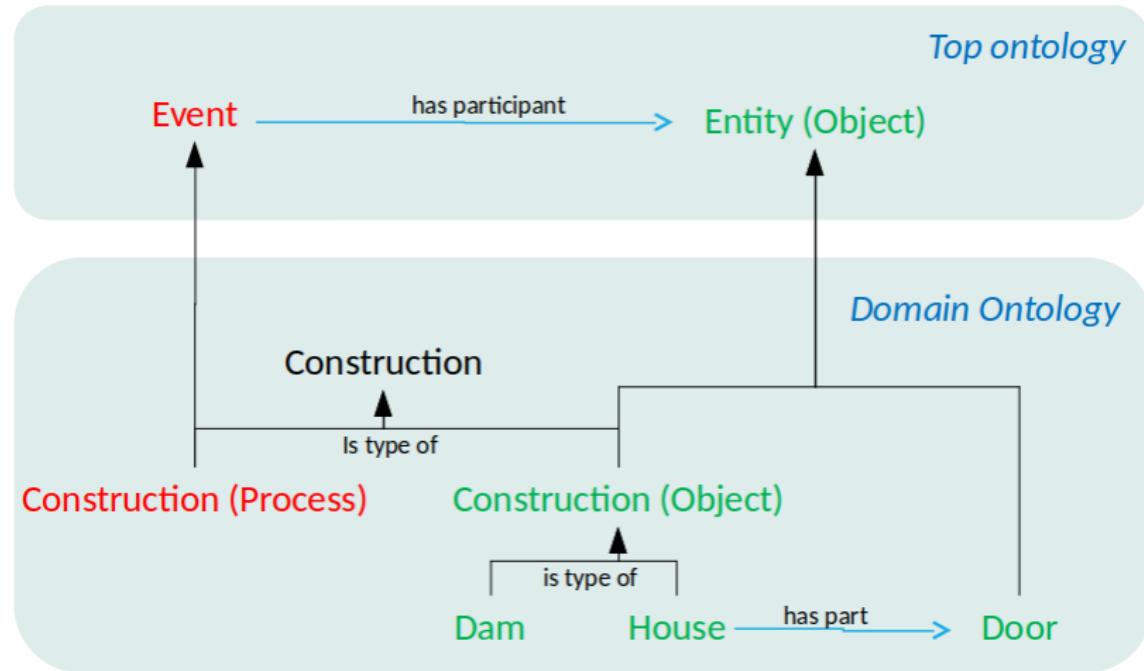

Third, Computers Can Understand One Another

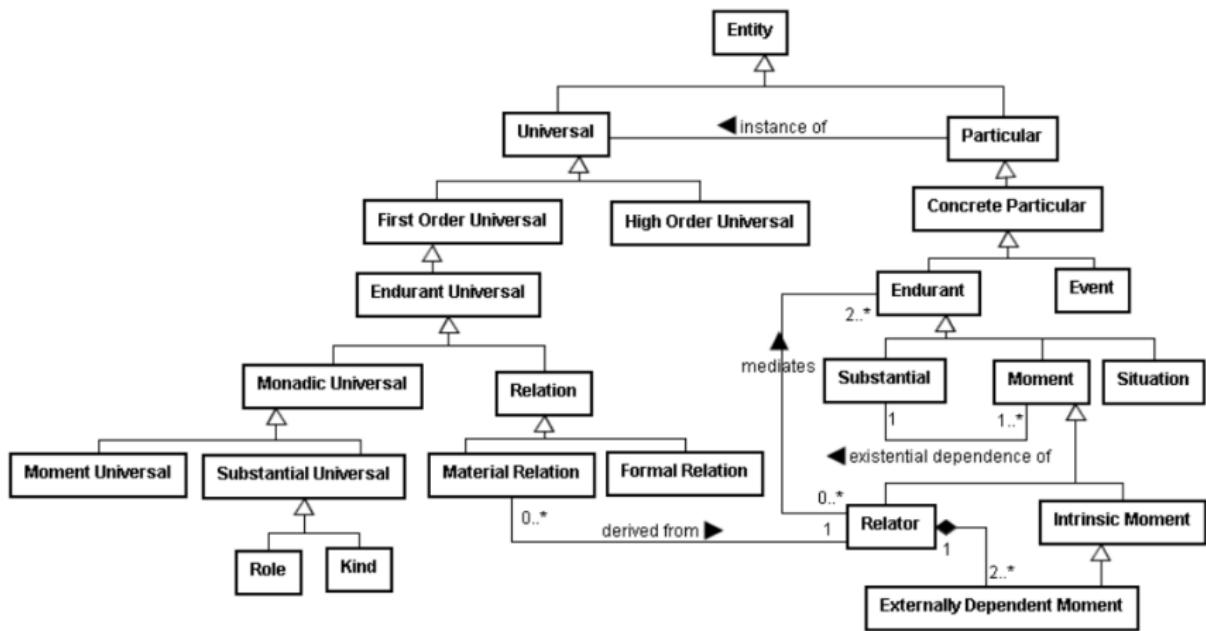

Ontology

Explicit Conceptualization of Shared Meaning

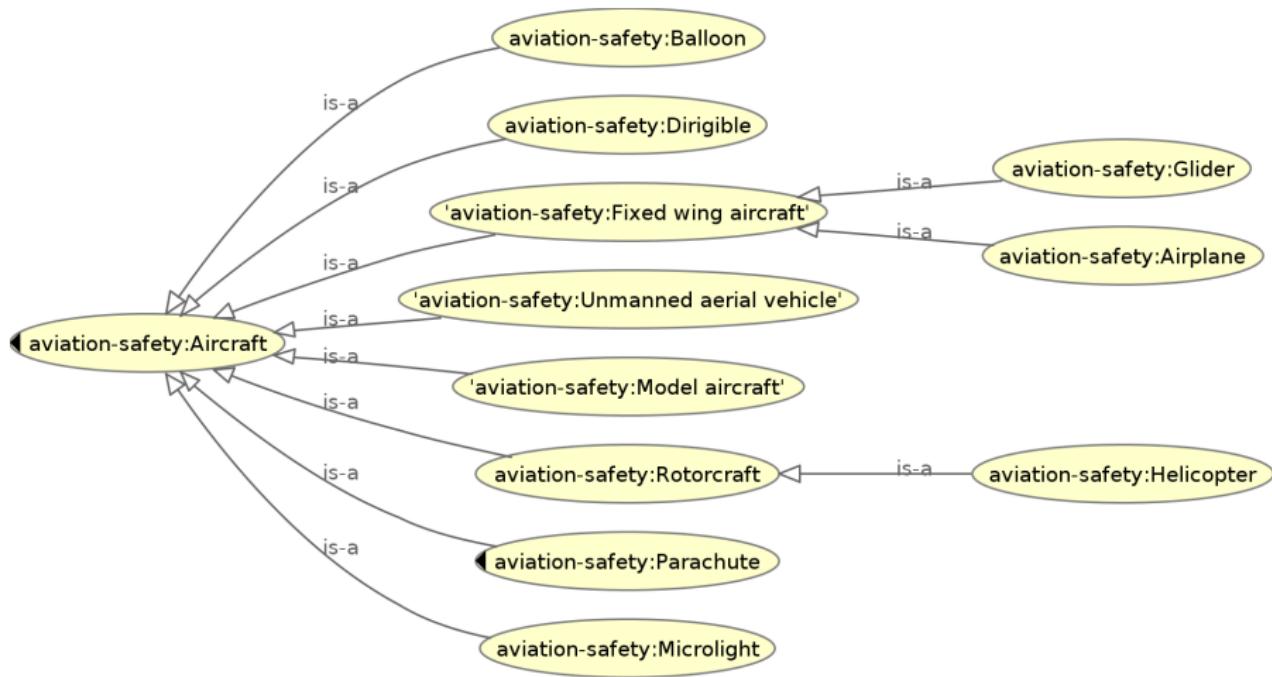

Example Top-Level Ontology

Small part of Unified Foundational Ontology (UFO)

Example Ontology Hierarchy

Each helicopter is also an aircraft.

Ontologies ≠ Taxonomies

Taxonomies = just a single type of relationship.

| | |
|---------------------|--|
| Construction | → broad meaning (object, construction site, process) |
| Dam | |
| House | → broad meaning (dwelling, construction) |
| Door | → specific meaning (not type of house, but its part) |

Ontologies for data integration

1

Sharing meaning of data

- Some examples of misunderstanding
- What is a dataset about?
- From conceptual models to ontologies
- **Ontologies for data integration**

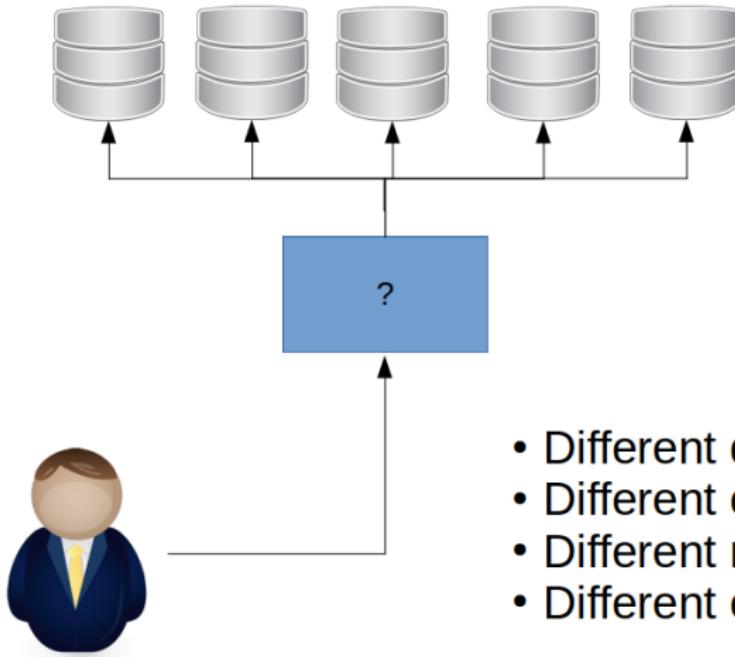

2

Semantic Web

- Linked Data
- Use-case: Open Data
- Semantic Web Adopters

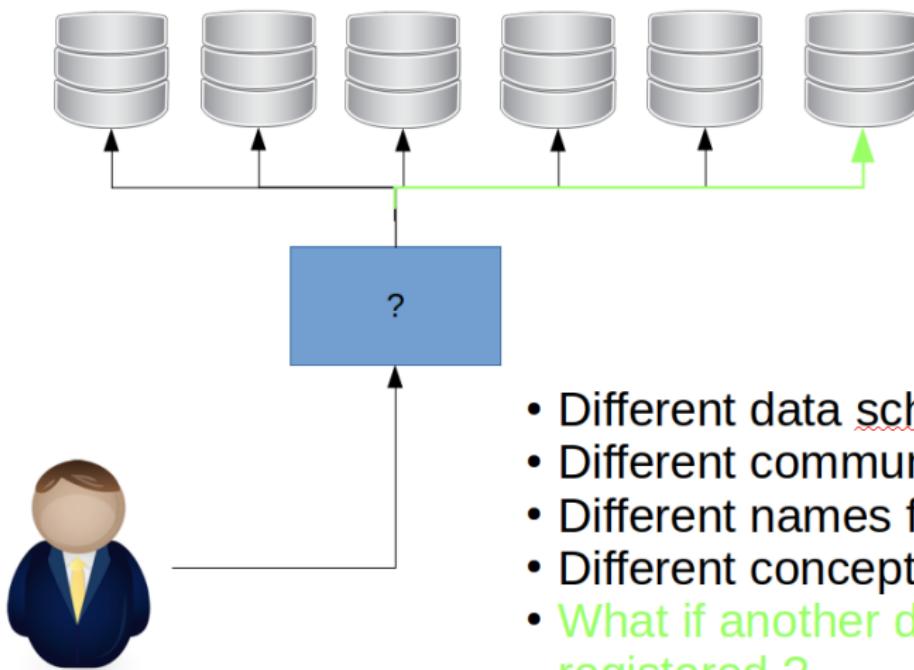

Data Integration Scenario

- Different data schemas
- Different communication speeds
- Different names for a concept
- Different concepts for one term

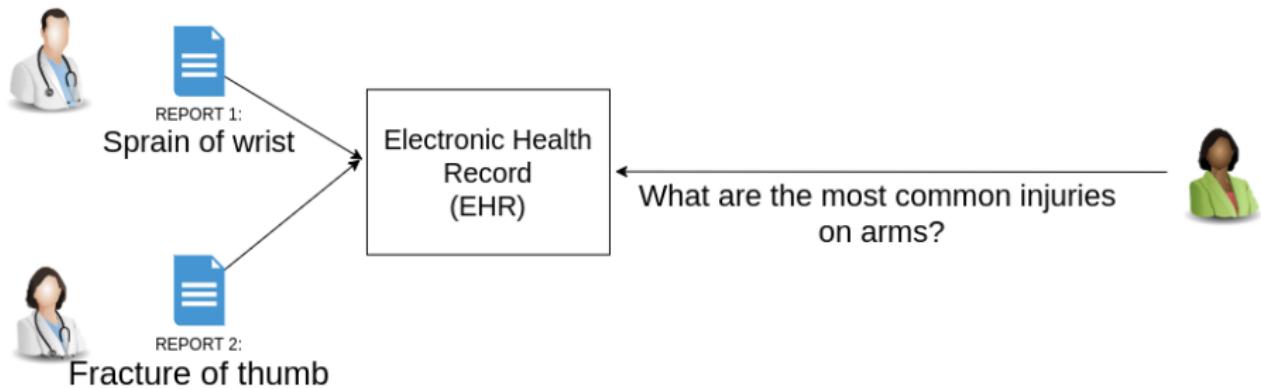

Data Integration Scenario

- Different data schemas
- Different communication speeds
- Different names for a concept
- Different concepts for one term
- What if another data source gets registered ?

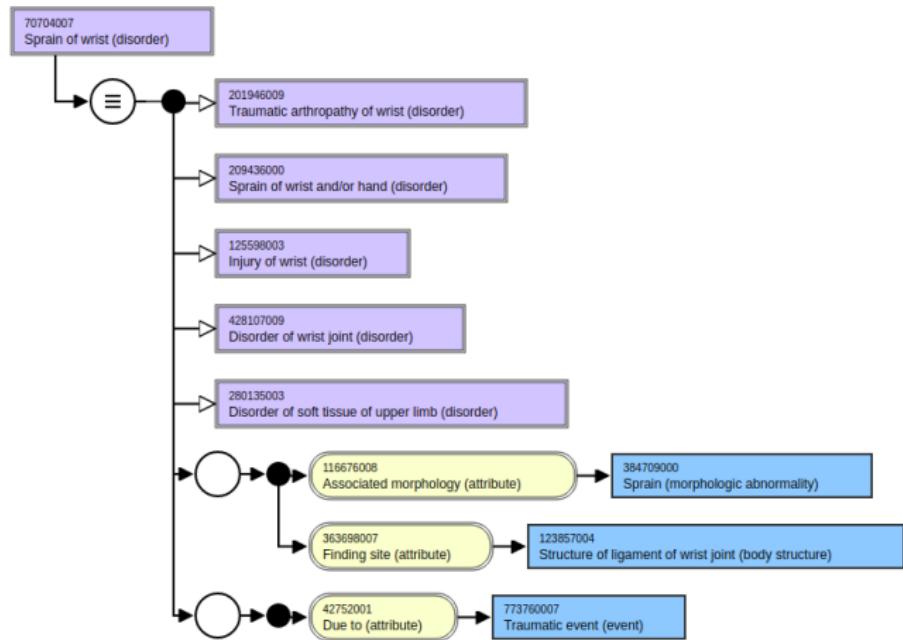

Use-case – HealthCare Data Integration

SNOMED-CT

Systematized Nomenclature of Medicine - Clinical Terms

- ~ 300k clinical concepts
- international standard – adopted e.g. in UK, USA, Australia
- uses ontology reasoning to classify/query the concepts

SNOMED-CT

Systematized Nomenclature of Medicine - Clinical Terms

2

Semantic Web

- Linked Data
- Use-case: Open Data
- Semantic Web Adopters

Semantic Web

Current Web vs. Semantic Web

- SoA – semistructured HTML or XML data. There is vast amount of search engines like Google, Yahoo, MSN, etc. Many of them are invaluable, but as the engines use just keywords and/or some natural language preprocessing methods, the search results contain lots of irrelevant results that need to be processed manually.

Current Web vs. Semantic Web

- SoA – semistructured HTML or XML data. There is vast amount of search engines like Google, Yahoo, MSN, etc. Many of them are invaluable, but as the engines use just keywords and/or some natural language preprocessing methods, the search results contain lots of irrelevant results that need to be processed manually.
- How to make web search more efficient ?

Current Web vs. Semantic Web

- SoA – semistructured HTML or XML data. There is vast amount of search engines like Google, Yahoo, MSN, etc. Many of them are invaluable, but as the engines use just keywords and/or some natural language preprocessing methods, the search results contain lots of irrelevant results that need to be processed manually.
- How to make web search more efficient ?
 - more expressive power for web designers to capture complexities – SW languages (RDF(S), OWL),

Current Web vs. Semantic Web

- How to make web search more efficient ?
 - more expressive power for web designers to capture complexities – SW languages (RDF(S), OWL),
 - more efficient search engines to handle SW languages – new inference techniques for these languages,
 - better search engines interfaces – more expressive query languages
- **the amount of (unstructured) data is steadily growing**

Semantic search

Ontologies and Semantic Web

ontology has many definitions, but let's consider it **a formal representation of a complex domain knowledge that is shared with others to ensure intelligent system interoperability**,

semantic web is *an extension of the current Web in which information is given well-defined meaning, better enabling computers and people to work in cooperation.* (cit. Semantic Web. Tim Berners-Lee, James Hendler and Ora Lassila, Scientific American, 2001)

Idea of Semantic Web

- W3C web page - <http://www.w3.org/2001/sw>

Idea of Semantic Web

- W3C web page - <http://www.w3.org/2001/sw>
- The data format will be either RDF(S) or OWL,

Idea of Semantic Web

- W3C web page - <http://www.w3.org/2001/sw>
- The data format will be either RDF(S) or OWL,
- Reasoners for RDF(S) can be used for partial derivation in OWL,

Idea of Semantic Web

- W3C web page - <http://www.w3.org/2001/sw>
- The data format will be either RDF(S) or OWL,
- Reasoners for RDF(S) can be used for partial derivation in OWL,
- Reasoners for OWL can be used for derivation in RDF(S)

Unique Data Identification – URIs

Semantic web speaks about resources.

URI is a unique identifier for addressing web resources in the form

<scheme name> : <hier. part> [? <query>] [# <fragment>]
. HTTP scheme is used typically.

URN a URI with *scheme name* equal to 'urn'; used e.g. in SWRL atom identification,

URL a URI that can be resolved to a content using the protocol (e.g. HTTP),

IRI generalization of URIs allowing non-ascii characters. IRI is the standard identifier for OWL.

Open World Assumption

The semantic web inference must take into account that we handle *incomplete knowledge*.

Description

Open world (OWA): Everything that cannot be proven is unknown,
Closed world (CWA): Everything that cannot be proven is false.

Statement : “John is a Man.”

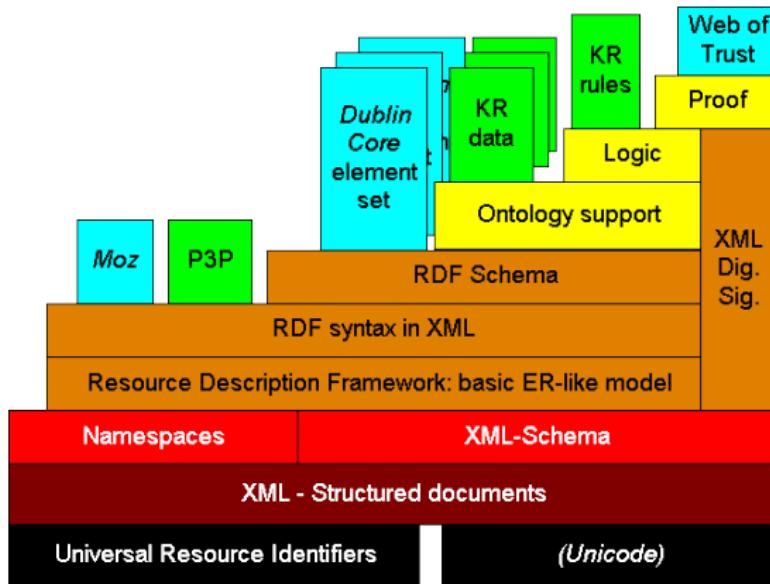

Query: “Is Jack a Man ?”

OWA Answer: “I don’t know.”

CWA Answer: “No.”

Semantic Web Stack

- Some examples of misunderstanding
- What is a dataset about?
- From conceptual models to ontologies
- Ontologies for data integration

2

Semantic Web

● Linked Data

- Use-case: Open Data
- Semantic Web Adopters

How to publish data related to other ?

Based on semantic web principles, Linked Data provide means to efficiently connect data created by different publishers.

- Web of Documents – WWW
 - webpage – readable by human
 - identifiers – IRI
 - transfer protocol – HTTP
 - unified language – HTML

- Web of Data – Linked Data
 - webpage – readable by machine
 - identifiers – IRI
 - transfer protocol – HTTP
 - unified language – RDF

Linked Data [**Heath2011**] is a method for publishing structured and interlinked data on the web, building up on URIs, HTTP and RDF technologies.

Linked Data Principles

- ① Use URIs as names for things.
- ② Use HTTP URIs so that people can look up those names.
- ③ When someone looks up a URI, provide useful information, using the standards (RDF, SPARQL).
- ④ Include links to other URIs, so that they can discover more things.

(Tim Berners-Lee, 2009 – <http://www.w3.org/DesignIssues/LinkedData.html>)

URIs satisfying the third point are **dereferencable**.

Document vs. its Content

When designing a URI scheme it is necessary to ensure proper distinction between a **document** and its **content**

Example

```
@prefix people: <http://example.com/people/>
people:John people:likes people:Mary
```

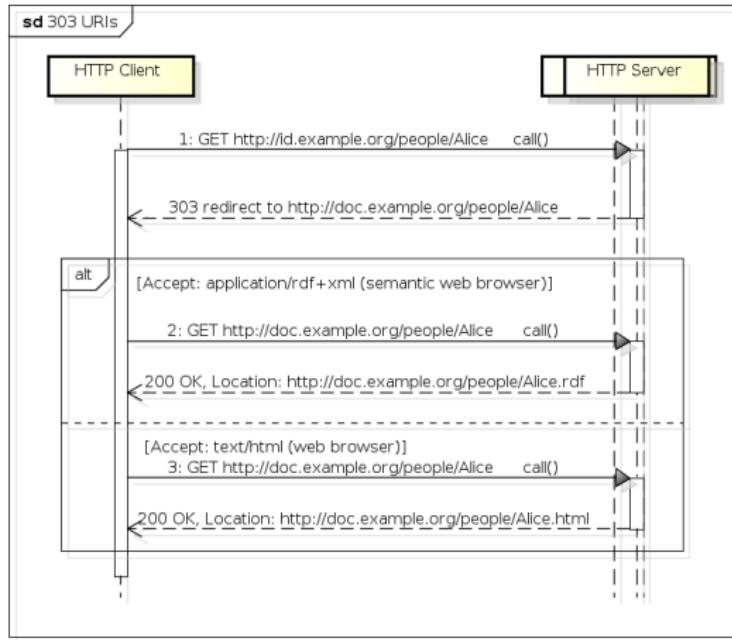

Is <http://example.com/people/Mary> a web document or a resource ? (Consider semantic consequences of each option).

This is handled by two strategies – 303 URIs and Hash URIs, each being suitable for different scenarios.

303 URIs

- 303 URIs are of the form `http://id.example.org/people/Alice`
- HTTP server sends 303 redirect to the corresponding **document** of the requested **resource**.
- HTTP client makes another request, based on Accept headers, the RDF/HTML version is delivered.

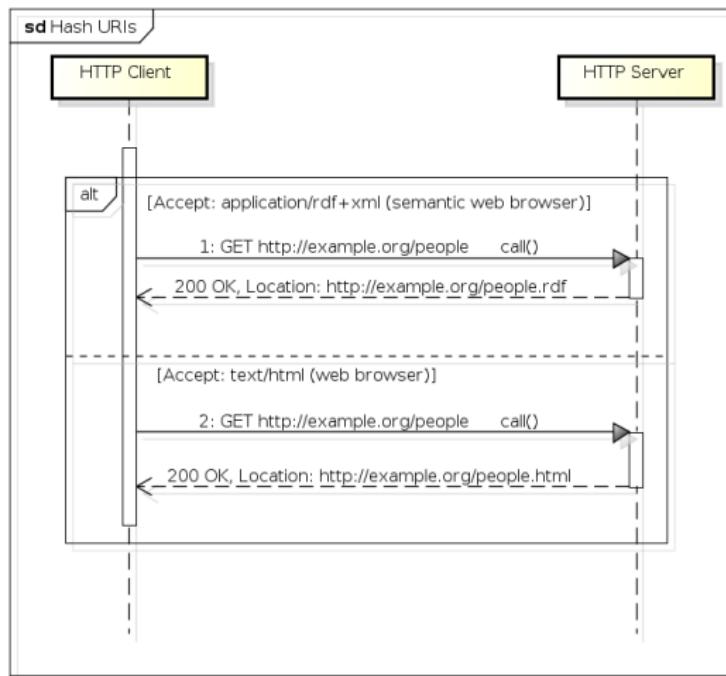

powered by Astah

Hash URLs

- Hash URLs are of the form `http://example.org/people#Alice`
- HTTP server sends the whole **document** of either RDF or HTML type based on Accept headers.
- Within the document, the HTTP client gets the particular entity after the hash symbol.

powered by Astah

303 URIs vs. Hash URIs

Hash URIs are suitable for small datasets that will hardly grow up,

303 URIs are suitable for large datasets for the sake of good performance.

Reason

The fragment part of an URL (after #) is evaluated on the HTTP client (not the HTTP server), so the HTTP client must fetch all data first and then filter them for the subsequent use locally.

Linked data presentation

LodView (2023, <https://github.com/LodLive/LodView>) a publication tool for Linked Data

Marmotta (2018, <https://github.com/apache/marmotta>) is a platform for publishing Linked Data (contributed from Linked Media Framework),

Callimachus (2017, <https://github.com/3-Round-Stones/callimachus>) is an application server for linked data applications. To be explored in the tutorials,

D2R (2015, <https://github.com/d2rq/d2rq>) is a platform for publishing relational database data in the form of Linked Data.

Pubby (2014, <https://github.com/cygri/pubby>) is a simple Linked Data publication server connectable to SPARQL endpoints,

Use-case: Open Data

1

Sharing meaning of data

- From conceptual models to ontologies
- Ontologies for data integration

2

Semantic Web

- Linked Data
- Use-case: Open Data
- Semantic Web Adopters

CKAN and DataHub

CKAN (<http://ckan.org/>) is an open-source data portal for publishing, sharing and search of datasets.

It is prominently hosted at <http://datahub.io>. Datasets on DataHub can be submitted to the Linked Data Cloud.

The screenshot shows the DataHub website's dataset search interface. At the top, there is a navigation bar with links for Datasets, Organizations, About, Blog, Help, and a search bar. Below the navigation is a sidebar with filters for 'Organizations' (Global, Linking Open Data, VU University Amsterdam, The Getty Trust, Public Domain, Open GLAM, Library Linked Data, Czech Technical Univ., Civil Society) and 'Tags' (culturalheritage, publications, culture, cultural, published-by-producer, museum, heritage, publicdomain, passage-type-catalog). The main content area displays a search result for "cultural heritage" with 14 datasets found. The first dataset listed is "Swedish Open Cultural Heritage" (SOCH), which is described as a collection of over 3.4 million cultural heritage objects from various museums and other local, regional, and national cultural heritage institutions. Below this is a section for "Culture Grid" and "Flickr - The Commons". Further down is a dataset for "Amsterdam Museum as Linked Open Data in the Europeana Data Model". The bottom of the page features a "British Museum Collection" section and a footer with links for CKAN, GitHub, and SPARQL.

Open Data Levels

Taken from <http://5stardata.info/cs/>.

Open Data Levels – description

- ★ Available on the web (whatever format) but with an open licence, to be Open Data
- ★★ Available as machine-readable structured data (e.g. excel instead of image scan of a table)
- ★★★ All the above, plus – Non-proprietary format (e.g. CSV instead of excel)
- ★★★★ All the above, plus – Use open standards from W3C (RDF and SPARQL) to identify things, so that people can point at your stuff
- ★★★★★ All the above, plus – Link your data to other people's data to provide context

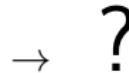

(Tim Berners-Lee, 2009 – <http://www.w3.org/DesignIssues/LinkedData.html>)
