

# Querying Semantic Web – SPARQL

Petr Křemen

[petr.kremen@fel.cvut.cz](mailto:petr.kremen@fel.cvut.cz)

October 16, 2018

# Outline

## 1 SPARQL

- SPARQL Basics
- SPARQL Update (Graph Update Operations)

## SPARQL

- SPARQL Basics
- SPARQL Update (Graph Update Operations)

# SPARQL

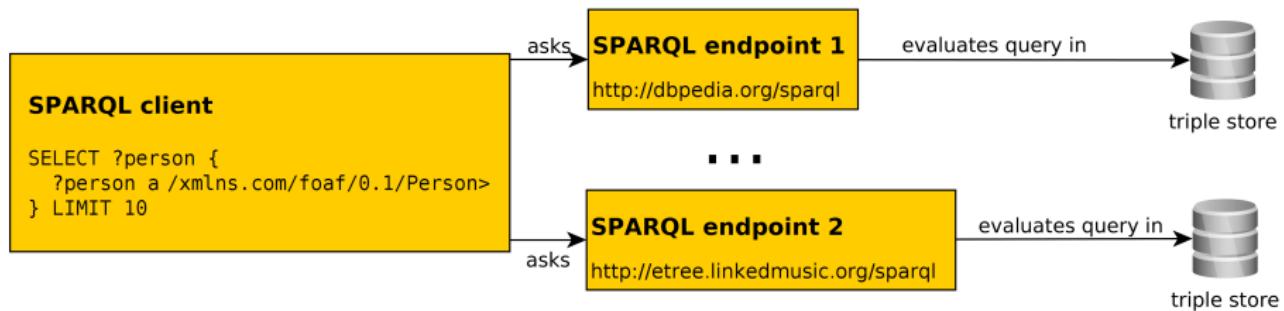

# A simple SPARQL Query

```
SELECT ?person {  
?person a <http://xmlns.com/foaf/0.1/Person> .  
} LIMIT 10
```

To be queried over RDF data inside a **SPARQL endpoint**, e.g.  
<http://dbpedia.org/sparql>

# SPARQL idea

# SPARQL Factsheet

- SPARQL 1.1 – 12 W3C Recommendations on 21 March 2013, covering
  - a query language (SPARQL 1.1 Query Language) [2]

# SPARQL Factsheet

  - a query language (SPARQL 1.1 Query Language) [2]
  - an update language (SPARQL 1.1. Update language)
  - SPARQL services (protocol over HTTP, graph management HTTP protocol),
  - an extension for executing distributed queries over more SPARQL endpoints [1]

# SPARQL Factsheet

- SPARQL 1.1 – 12 W3C Recommendations on 21 March 2013, covering
  - a query language (SPARQL 1.1 Query Language) [2]
  - an update language (SPARQL 1.1. Update language)
  - SPARQL services (protocol over HTTP, graph management HTTP protocol),
  - an extension for executing distributed queries over more SPARQL endpoints [1]
  - JSON, CSV, TSV, XML query result formats [4]

# SPARQL Factsheet

- SPARQL 1.1 – 12 W3C Recommendations on 21 March 2013, covering
  - a query language (SPARQL 1.1 Query Language) [2]
  - an update language (SPARQL 1.1. Update language)
  - SPARQL services (protocol over HTTP, graph management HTTP protocol),
  - an extension for executing distributed queries over more SPARQL endpoints [1]
  - JSON, CSV, TSV, XML query result formats [4]
  - definition of entailment regimes for RDF extensions (e.g. OWL, more in lecture 10) [3].

# SPARQL for RDF is like SQL for RDBMS

*'Get projects having male administrators starting on the letter N'*

```
SELECT e.surname AS es,
       p.name AS pn
  FROM employee e, project p
 WHERE e.gender = 'male'
   AND p.administratorId = e.id
   AND e.surname LIKE 'N\%';
```

```
PREFIX : <http://example.org/>
SELECT ?sn, (?projname AS ?pn)
WHERE {
  ?e a :Employee .
  ?e :surname ?sn .
  ?e :gender 'male' .
  ?p a :Project .
  ?p :name ?pn .
  ?p :administrator ?e .
  FILTER (strstarts(?sn, 'N'))
}
```

However, SPARQL is less powerful comparing to SQL in terms of built-in functions, or subqueries

# Is SPARQL the only one ?

Some previous attempts to query SPARQL include:

reactive-rule languages – e.g. Algea

path-based languages – e.g. Versa

relational-based – TRIPLE, Xcerpt, SeRQL

At present

SPARQL is **The standard** for querying RDF. In addition, graph languages have been gaining popularity for querying RDF (e.g. GraphQL <https://graphql.org/>).

# SPARQL Basics

1

SPARQL

● SPARQL Basics

● SPARQL Update (Graph Update Operations)

# Query Types

**SELECT** – returns a binding table (similarly to SQL)

# Query Types

**SELECT** – returns a binding table (similarly to SQL)

**ASK** – returns a true/false indicating existence of the given pattern in the RDF graph

# Query Types

**SELECT** – returns a binding table (similarly to SQL)

**ASK** – returns a true/false indicating existence of the given pattern in the RDF graph

**CONSTRUCT** – returns an RDF graph constructed from the binding table

# Query Types

**SELECT** – returns a binding table (similarly to SQL)

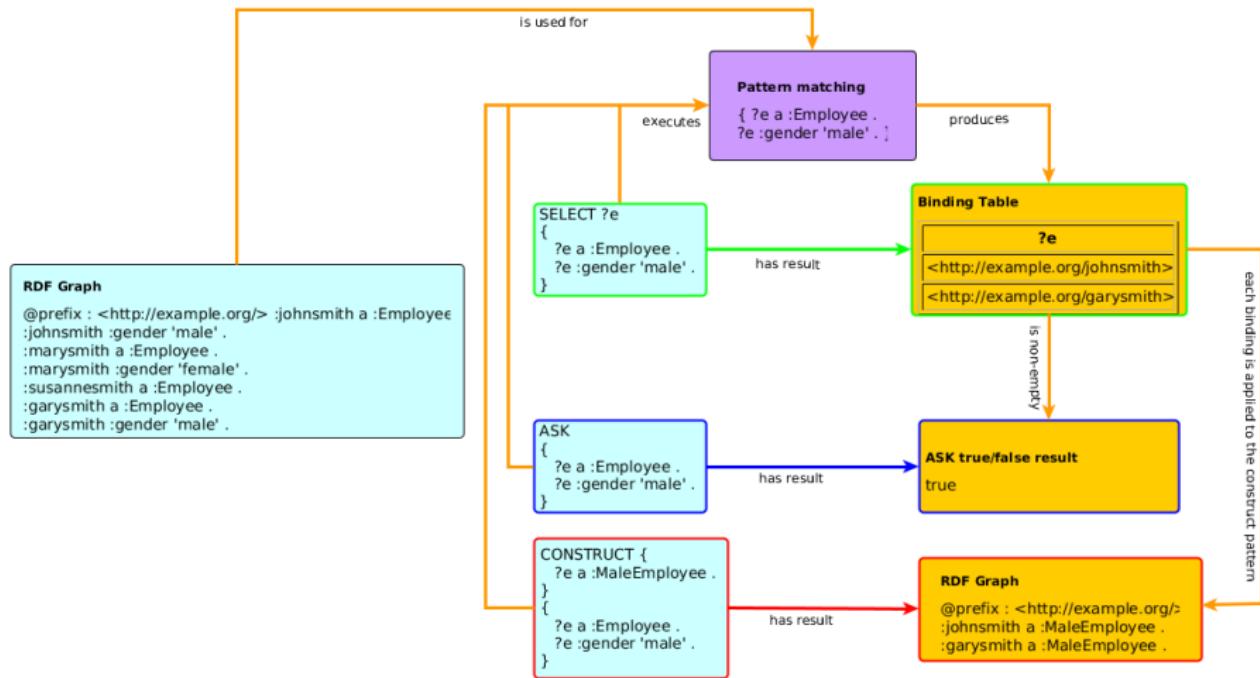

**ASK** – returns a true/false indicating existence of the given pattern in the RDF graph

**CONSTRUCT** – returns an RDF graph constructed from the binding table

**DESCRIBE** – returns an RDF graph describing the given resource  
(semantics not fixed)

# Query Evaluation

# Basic Definitions (1)

RDF Term  $\in T = T_I \cup T_B \cup T_L$ , being a union of set of all IRIs, blank nodes and literals respectively.

## example

```
:a    <http://example.org/data/John>    "John"@en
```

solution is a mapping  $\mu : V \rightarrow T$  assigning an RDF term to each variable from the query,

## example

$$\mu = \{(\textit{?person} \rightarrow <\text{http://example.org/data/John}>), (\textit{?personName} \rightarrow \text{"John"@en})\}$$

result set is a list  $R = (\mu_1, \dots, \mu_n)$  of solutions,

## Basic Definitions (2)

triple pattern (TP) is a member of  $(T \cup V) \times (T_I \cup V) \times (T \cup V)$ ,

example

$(?person, a, foaf : Person)$

or in the turtle syntax

?person a foaf:Person

basic graph pattern (BGP) is a set  $BGP = \{TP_1, \dots, TP_n\}$  of triple patterns.

example

?person a foaf:Person. ?person rdfs:label ?label.

graph store is a mutable container providing an RDF dataset at each time,

# Basic Graph Patterns

Repository content:

```

@prefix : <http://example.org/>
@prefix r: <http://dbpedia.org/resource/>
@prefix rdfs: <http://www.w3.org/2000/01/rdf-schema#>
:inventors {
  r:Thomas_Edison :invented :bulb .
  r:J_Cimrman :invented :bulb .
  :bulb rdfs:label "Bulb"@en , "Zarovka"@cs .
  :wheel rdfs:label "Wheel"@en .
  _:x :invented :wheel .
  _:y :invented :SteamEngine .
  _:z :invented :Gunpowder .
  :Gunpowder rdfs:label "Strelny prach"@cs .
}

```

Query with a BGP

```

PREFIX : <http://example.org/>
PREFIX rdfs: <http://www.w3.org/2000/01/rdf-schema#>
SELECT ?s ?l
WHERE {
  ?s :invented ?i.
  ?i rdfs:label ?l.
}

```

Table: Result set

s	
r:Thomas_Edison	"Bulb"@en
r:J_Cimrman	"Bulb"@en
r:Thomas_Edison	"Zarovka"@cs
r:J_Cimrman	"Zarovka"@cs
_:a	"Wheel"@en
_:b	"Strelny prach"@cs

# Filtering results

## Description

syntax BGP1 **FILTER**(boolean condition) BGP1

description **FILTER** clause filters BGP results (anywhere in a BGP)

## Query with a BGP

```
PREFIX : <http://example.org/>
PREFIX rdfs:
→ <http://www.w3.org/2000/01/rdf-schema#>
SELECT ?s ?l
WHERE {
  ?s :invented ?i.
  ?i rdfs:label ?l
  FILTER(regex(?l, ".ul.*"))
    && contains(str(?s), "Cimr"))
}
```

- string functions – e.g. `strlen`, `contains`, `substr`, `concat`, `regex`, `replace`
- RDF term functions – e.g. `isIRI`, `IRI`, `isBlank`, `BNODE`, `isLiteral`, `str`, `lang`, `datatype`

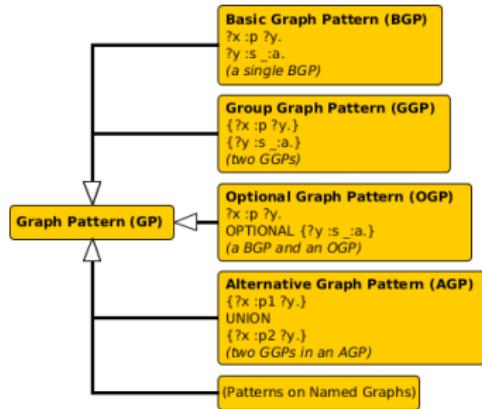

See SPARQL 1.1 spec.

<https://www.w3.org/TR/2013/REC-sparql11-query-20130321/>

# Graph Patterns – Overview

Graph patterns cover all basic algebraic operations:

- conjunction (sequence of graph patterns),
- disjunction (**UNION** pattern),
- negation (**FILTER NOT EXISTS, MINUS**)
- conditional conjunction (**OPTIONAL**)

# Optional data

## Description

syntax **GP1 OPTIONAL { GP2 }**

description results of GP1 are optionally augmented with results of GP2, if any. Optionals are left-associative.

## Two optionals

```
PREFIX : <http://example.org/>
PREFIX rdfs:
→ <http://www.w3.org/2000/01/rdf-schema#>
SELECT ?s ?i ?l
WHERE {
    ?s :invented ?i.
    OPTIONAL {
        ?i rdfs:label ?l FILTER (lang(?l)="en").
    } OPTIONAL {
        ?i rdfs:label ?l FILTER (lang(?l)="cs")
    }
}
```

Table: Result set

s	l
r:Thomas_Edison	"Bulb"@en
r:J_Cimrman	"Bulb"@en
:a	"Wheel"@en
:b	
:c	"Strelny prach"@cs

# Other examples

## FILTERing with regular expressions

```
PREFIX dc: <http://purl.org/dc/elements/1.1/>
SELECT ?title
WHERE { ?x dc:title ?title .
?x dc:author ?author
FILTER regex(?title, ".SPARQL") }
```

## Order of OPTIONALs might be important

```
PREFIX rdf: <http://www.w3.org/1999/02/22-rdf-syntax-ns#>
PREFIX books: <http://books.example.org>
SELECT ?writing ?name
WHERE
{ ?writing rdf:type books:Essay .
OPTIONAL { ?writing books:translator ?p . ?p dc:name ?name . } .
OPTIONAL { ?writing books:author ?p . ?p dc:name ?name . } }
```

# Negation

negation as failure – i.e. what cannot be inferred is considered false.

two constructs – **MINUS** vs. **FILTER NOT EXISTS**

## MINUS

```
PREFIX : <http://example.org/>
PREFIX rdfs:
→ <http://www.w3.org/2000/01/rdf-schema#>
SELECT ?s1 ?i
{ ?s1 :invented ?i.
  MINUS {
    ?s2 :invented ?i .
    FILTER(?s1 != ?s2) . }}
```

Variable `?s1` is not bound in the **MINUS** pattern. Returns all inventors.

## FILTER NOT EXISTS

```
PREFIX : <http://example.org/>
PREFIX rdfs:
→ <http://www.w3.org/2000/01/rdf-schema#>
SELECT ?s1 ?i
{
  ?s1 :invented ?i.
  FILTER NOT EXISTS {
    ?s2 :invented ?i .
    FILTER(?s1 != ?s2) . }}
```

Returns all inventions that were invented just by one inventor.

# Property Paths

## Description

Property paths allow to express simple regular expressions on properties, as follows

syntax	matches ( $e_{(i)}$ means path element, $p_{(i)}$ means <i>iri</i> or $\text{^iri}$ )
<i>iri</i>	an IRI (path of length 1)
$\text{^ } e$	an inverse path ( $\text{o} \rightarrow \text{s}$ )
$e_1 / e_2$	a sequence path of $e_1$ followed by $e_2$
$e_1   e_2$	an alternative path of $e_1$ or $e_2$
$e^*$	a sequence path of zero or more matches of $e$
$e^+$	a sequence path of one or more matches of $e$
$e^?$	a sequence path of zero or one more matches of $e$
$!(p_1   \dots   p_n)$	any IRI not matching any of $p_i$
$(e)$	group path (brackets for precedence)

# Property Paths – Examples

Get the name of a resource

```
PREFIX dc: <http://purl.org/dc/elements/1.1/>
PREFIX rdfs: <http://www.w3.org/2000/01/rdf-schema#>
SELECT *
{
    ?s rdfs:label|dc:title ?name.
}
```

Get elements of an RDF collection

```
PREFIX dc: <http://purl.org/dc/elements/1.1/>
PREFIX rdfs: <http://www.w3.org/2000/01/rdf-schema#>
SELECT *
{
    ?s (rdf:rest*)/rdf:first ?listItem.
}
```

# Aggregations

## Description

Similarly to SQL, SPARQL allows using aggregation functions for numeric/string data:

**COUNT** (?var), or **COUNT(DISTINCT ?var)** – counts number of (distinct) occurrences of ?var in the resultset,

**MIN** (?v), **MAX** (?v), **SUM** (?v), **AVG** (?v) – analogous to their SQL counterparts,

**GROUP\_CONCAT** (?var; separator = <SEP>) AS ?group) – concatenates all elements in the group with the given separator character,

**SAMPLE** – takes an arbitrary representative from the group.

Usage of (?expr as ?var) alias is obligatory.

Similarly to SQL, SPARQL allows computing aggregates over particular data groups and filter in them using **GROUP BY/HAVING** construct.

# Aggregation – Examples

Compute the number of inventions of each inventor.

```
PREFIX : <http://example.org/>
PREFIX rdfs: <http://www.w3.org/2000/01/rdf-schema#>
SELECT (COUNT(?s) as ?count) ?i (GROUP_CONCAT(?s;separator=",") as
  ?inventors)
FROM :inventors
WHERE {
    ?s :invented ?i.
}
GROUP BY ?i
HAVING (COUNT(?s) > 1)
```

# Variable assignment

## Description

Variables can be assigned results of function (or aggregation function). The syntax is `(expr AS ?v)`, where `expr` is an expression and `?v` is the newly created variable not appearing before.

Compute the number of inventions of each inventor.

```
PREFIX : <http://example.org/>
PREFIX rdfs: <http://www.w3.org/2000/01/rdf-schema#>
SELECT (COUNT(?s) AS ?count) ?invention
FROM :inventors
WHERE {
    ?s :invented ?i .
    ?i rdfs:label ?l
    BIND (concat("Invention: ",?l) AS ?invention)
}
GROUP BY ?i ?invention
```

# Distributed Queries

## Syntax and semantics

**syntax** ... **SERVICE (SILENT)** *sparqlServiceURI* { **GP** }

**semantics** this clause poses a sparql query described by graph pattern **GP** to a remote SPARQL endpoint *sparqlServiceURI*

## DBpedia service query

```
PREFIX : <http://example.org/>
PREFIX p: <http://dbpedia.org/property/>
PREFIX r: <http://dbpedia.org/resource/>
SELECT ?s ?p ?o ?i
WHERE {
  GRAPH :inventors { ?s :invented ?i. }
  OPTIONAL { SERVICE SILENT
    <http://dbpedia.org/sparql> {
      ?s ?p ?o
      FILTER( strstarts(str(?p),
        concat(str(p:), "death")) ) } }}
```

## Local repo content

```
@prefix : <http://example.org/>
@prefix p:
<http://dbpedia.org/property/>
@prefix r:
<http://dbpedia.org/resource/>
:inventors {
  r:Thomas_Edison :invented :bulb.
  r:J_Cimrman :invented :bulb.
}
```

# Selected Other Features

- **VALUES** – predefined variable bindining specified in the tabular form

# Selected Other Features

- **VALUES** – predefined variable bindining specified in the tabular form
- **ORDER BY, LIMIT, OFFSET** – used analogously to SQL

# Selected Other Features

- **VALUES** – predefined variable bindining specified in the tabular form
- **ORDER BY, LIMIT, OFFSET** – used analogously to SQL
- **FROM, FROM NAMED** – used to specify active default/named graphs for the query

# Selected Other Features

- **VALUES** – predefined variable bindining specified in the tabular form
- **ORDER BY, LIMIT, OFFSET** – used analogously to SQL
- **FROM, FROM NAMED** – used to specify active default/named graphs for the query
- **SELECT DISTINCT** – removes duplicates from the results

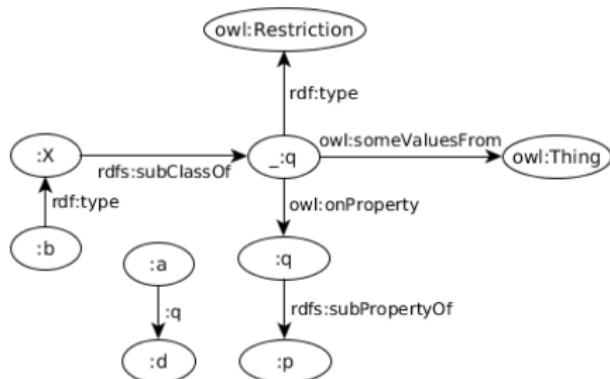

# SPARQL Entailment Regimes

- simply – SPARQL spec. [2] defines evaluation of BGPs w.r.t. *simple entailment*
- [3] defines several other entailment regimes for SPARQL BGPs:  
**RDF entailment**, **RDFS entailment**, **D-entailment**, as defined in RDF spec.  
**OWL 2 entailments**, **RIF entailment**, that are much more expressive, see lecture 10.  
... conditions for defining custom entailment regimes

All SPARQL entailment regimes must ensure

- compliance with the corresponding entailment (e.g. RDF, RDFS)
- finiteness of results
  - only *canonical* b-nodes can be returned (ensured by skolemization of both the query and the queried graph),
  - only finite part of respective vocabularies can be returned as query results (e.g. RDF vocabulary without `rdf:_n` properties not occurring in the graph).

# SPARQL Evaluation Semantics

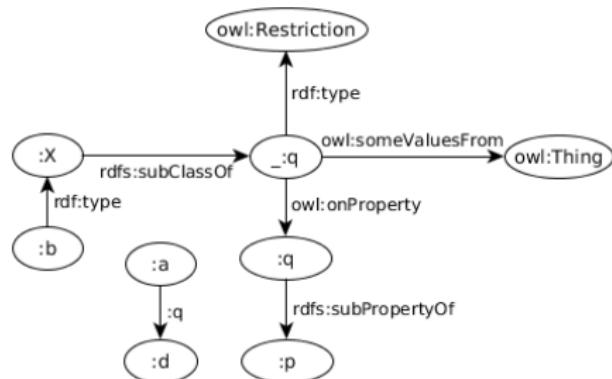

```
PREFIX : <http://ex.org/e1>
SELECT ?x
WHERE { ?x :p :d }
```

Simple-entailment No result.

# SPARQL Evaluation Semantics

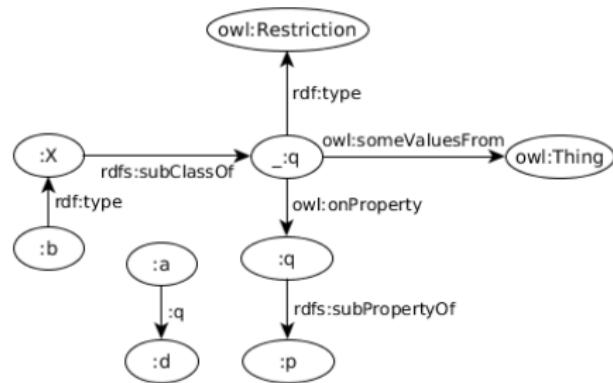

```
PREFIX : <http://ex.org/e1>
SELECT ?x
WHERE { ?x :p :d }
```

Simple-entailment No result.

RDF-entailment No result.

# SPARQL Evaluation Semantics

```
PREFIX : <http://ex.org/e1>
SELECT ?x
WHERE { ?x :p :d }
```

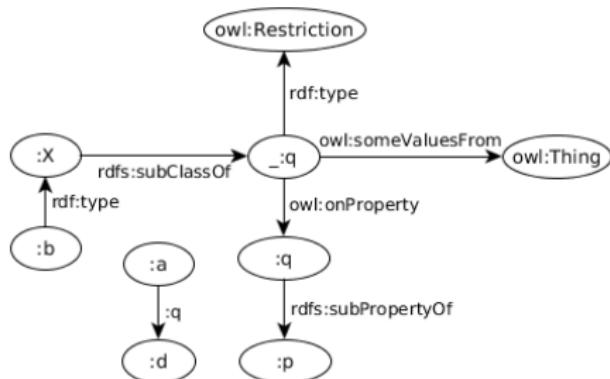

Simple-entailment No result.

RDF-entailment No result.

RDFS-entailment One result:  $?x = :a$ .

# SPARQL Evaluation Semantics

```
PREFIX : <http://ex.org/e1>
SELECT ?x
WHERE { ?x :p :d }
```

Simple-entailment No result.

RDF-entailment No result.

RDFS-entailment One result:  $?x = :a$ .

OWL-entailment Two results:  $?x = :a$  and  $?x = :b$ .

# SPARQL SELECT/ASK results

**CSV** for **SELECT**; loses information about datatypes/languages of RDF terms

**TSV** for **SELECT**; is lossless

**XML, JSON** for **SELECT, ASK**; is lossless, supports additional information (e.g. columns identification through *link* attribute),

```
{
  "head": {
    "vars": [ "person", "name" ]
  },
  "results": {
    "bindings": [
      {
        "person": {
          "type": "uri",
          "value": "http://ex.com/p1"
        },
        "name": {
          "type": "literal",
          "value": "Smith"
        }
      },
      {
        "person": {
          "type": "uri",
          "value": "http://ex.com/p2"
        }
      }
    ]
  }
}
```

# SPARQL Update (Graph Update Operations)

1

SPARQL

● SPARQL Basics

● SPARQL Update (Graph Update Operations)

# Inserting

```
PREFIX dc: <http://purl.org/dc/elements/1.1/>
INSERT { <http://example/person> dc:title "John" }
WHERE {}
```

# Deleting

```
PREFIX foaf: <http://xmlns.com/foaf/0.1/>
DELETE WHERE
?person a foaf:Person .
}
```

# Replacing

```
PREFIX foaf: <http://xmlns.com/foaf/0.1/>
DELETE { ?person a foaf:Person . }
INSERT { ?person a dbo:Person . }
WHERE { ?person a foaf:Person . }
```

## Other operations

- LOAD – loading a graph into a graph store
- CLEAR – clearing a graph inside a graph store
- CREATE – create a new graph in a graph store
- DROP – deletes a new graph in a graph store
- COPY – inserts all triples from one graph to another, clearing the dest.
- MOVE – moves all triples from one graph to another
- ADD – inserts all triples from one graph to another, keeping the dest.

See <https://www.w3.org/TR/sparql11-update/> for details
