Structures - struct Unions Type definition - typedef Enumerations - enum Bit-Fields	Structures - struct Unions Type definition - typedef Enumerations - enum Bit-Fields	Structures - struct Unions Type definition - typedef Enumerations - enum Bit-Fields		
Structures, Unions, and Enumerations	struct	Initialization of the Structure Variables and Assignment		
	Structure struct is composed of a finite set of data field members	Operator		
	that can be of different type	 Structure variables can be initialized in the declaration 		
	Structure is defined by the programmer as a new data type	 In C99, we can also use the designated initializers 		
Structure is a collection of values, possibly of different types	It allows storing a collection of the related data fields	struct {		
It is defined with the keyword struct	 Each structure has a separate name space for its members Dedemtion of the atom structure is 	<pre>int login_count; char name[USENAME_LEN + 1];</pre>		
Structures represent records of data fields	Declaration of the struct variable is #define USERNAME LEN 8	<pre>int last_login; } user1 = { 0, "admin", 1477134134 }, //get unix time 'date +%s'</pre>		
Union is also a collection of values, but its members share the	struct {	<pre>// designated initializers in C99 user2 = { .name = "root", .login_count = 128 };</pre>		
same storage	<pre>int login_count; char username[USERNAME_LEN + 1];</pre>	<pre>user2 = { .name = Foot , .login_count = F20 }, printf("User1 '%s' last login on: %d\n", user1.name, user1.last_login);</pre>		
Union can store one member at a time, but not all simultaneously.	<pre>int last_login; // date as the number of seconds</pre>	printf("User2 '%'s last login on: %d\n", user1.name, user1.nas_login);		
Enumeration represents named integer values	} user_account; // variable of the struct defined type	user2 = user1; // assignment operator structures		
	The declaration follows other variable declaration where struct	<pre>printf("User2'%s' last login on: %d\n", user2.name, user2.last_login); lec05/structure_init.c</pre>		
	$\{\ldots\}$ specifies the type and user_account the variable name	The assignment operator = is defined for the structure variables of		
	• We access the members using the . operator, e.g.,	the same type		
	<pre>user_account.login_count = 0;</pre>	No other operator like != or == is defined for the structures!		
Jan Faigl, 2019 B3B36PRG - Lecture 05: Data types 4 / 53 Structures - struct Unions Type definition - typedef Enumerations - enum Bit-Fields	Jan Faigl, 2019 B3B36PRG - Lecture 05: Data types 6 / 53 Structures - struct Unions Type definition - typedef Enumerations - enum Bit-Fields	Jan Faigl, 2019 B3B36PRG - Lecture 05: Data types 7 / 53 Structures - struct Unions Type definition - typedef Enumerations - enum Bit-Fields		
Structure Tag	Example of Defining Structure	Structure Tag and Structure Type		
Declaring a structure tag allows to identify a particular struc-	• Without definition of the new type (using (typedef) adding the	Using struct record we defined a new structure tag record		
ture and avoids repeating all the data fields in the structure variable	keyword struct before the structure tag is mandatory	<pre>struct record { int number;</pre>		
struct user_account {	<pre>struct record { typedef struct {</pre>	<pre>double value; };</pre>		
int login_count;	int number; int n;	The tag identifier record is defined in the name space of the		
<pre>char username[USERNAME_LEN + 1];</pre>	double value; double v;	structure tags It is not mixed with other type names		
<pre>int last_login;</pre>	}; } item;	Using the typedef, we introduced new type named record		
<pre>}; Notice VLA is not allowed in structure type.</pre>	record r; /* THIS IS NOT ALLOWED! */	typedef struct record record;		
After creating the user_account tag, variables can be declared	<pre>/* Type record is not known */</pre>			
<pre>struct user_account user1, user2;</pre>		 We defined a new global identifier record as the type name for the struct record 		
The defined tag is not a type name, therefore it has to be used	<pre>struct record r; /* Keyword struct is required */ item is(* turns item defined using turnedef */</pre>	 Structure tag and definition of the type can be combined 		
with the struct keyword	<pre>item i; /* type item defined using typedef */</pre>	typedef struct record {		
The new type can be defined using the typedef keyword as	Introducing new type by typedef, the defined struct type can be	int number; double value;		
<pre>typedef struct { } new_type_name;</pre>	used without the struct keyword lec05/struct.c	} record;

Structures - struct Unions Type definition - typedef Enumerations - enum Bit-Fields	Structures - struct Unions Type definition - typedef Enumerations - enum Bit-Fields	Structures - struct Unions Type definition - typedef Enumerations - enum Bit-Fields		
Example struct - Assignment	Example struct – Direct Copy of the Memory	Size of Structure Variables		
<pre>The assignment operator = can be used for two variables of the same struct type struct record { typedef struct { int number; int n; double value; double v; }; } item; struct record rec1 = { 10, 7.12 }; struct record rec2 = { 5, 13.1 }; item i; print_record(rec1); /* number(10), value(7.120000) */ print_record(rec2); /* number(5), value(13.100000) */ rec1 = rec2; i = rec1; /* THIS IS NOT ALLOWED! */ print_record(rec1); /* number(5), value(13.100000) */</pre>	<pre>Having two structure variables of the same size, the content can be directly copied using memory copy</pre>	<pre>Size of Structure Variables Data representation of the structure may be different from the sum of sizes of the particular data fields (types of the members) struct record { typedef struct { int number; int n; double value; double v; }; } item; printf("Size of int: %lu size of double: %lu\n", sizeof (int), sizeof(double)); printf("Size of record: %lu\n", sizeof(struct record)); printf("Size of item: %lu\n", sizeof(item)); Size of int: 4 size of double: 8 Size of record: 16 Size of item: 16</pre>		
lec05/struct.c	lec05/struct.c	lec05/struct.c		
Jan Faigl, 2019 B3B36PRG - Lecture 05: Data types 11 / 53 Structures - struct Unions Type definition - typedef Enumerations - enum Bit-Fields	Jan Faigl, 2019 B3B36PRG - Lecture 05: Data types 12 / 53 Structures - struct Unions Type definition - typedef Enumerations - enum Bit-Fields	Jan Faigl, 2019 B3B36PRG - Lecture 05: Data types 13 / 53 Structures - struct Unions Type definition - typedef Enumerations - enum Bit-Fields		
Size of Structure Variables 1/2	Size of Structure Variables 2/2	Accessing Members using Pointer to Structure		
 Compiler may align the data fields to the size of the word (address) of the particularly used architecture E.g., 8 bytes for 64-bits CPUs. 	<pre>printf("Size of int: %lu size of double: %lu\n",</pre>	 The operator -> can be used to access structure members using a pointer 		
A compact memory representation can be explicitly prescribed for the clang and gcc compilers by theattribute((packed)) struct record_packed {	<pre>printf("record_packed: %lu\n", sizeof(struct record_packed)); printf("item_packed: %lu\n", sizeof(item_packed));</pre>	<pre>typedef struct { int number; double value;</pre>		
<pre>int n; double v; }attribute((packed)); Or typedef structattribute((packed)) { int n;</pre>	Size of int: 4 size of double: 8 Size of record_packed: 12 Size of item_packed: 12 lec05/struct.c The address alignment provides better performance for addressing	<pre>} record_s; record_s a; record_s *p = &a</pre>		
<pre>double v; } item_packed; lec05/struct.c</pre>	the particular members at the cost of higher memory requirements http://www.catb.org/esr/structure-packing	<pre>printf("Number %d\n", p->number);</pre>		
Jan Faigl, 2019 B3B36PRG – Lecture 05: Data types 14 / 53 Structures - struct Unions Type definition - typedef Enumerations - enum Bit-Fields	Jan Faigl, 2019 B3B36PRG - Lecture 05: Data types 15 / 53 Structures - struct Unions Type definition - typedef Enumerations - enum Bit-Fields	Jan Faigl, 2019 B3B36PRG – Lecture 05: Data types 16 / 53 Structures – struct Unions Type definition – typedef Enumerations – enum Bit-Fields		
Structure Variables as a Function Parameter Structure variable can be pass to a function and also returned	Structures - struct Unions Type definition - typedef Enumerations - enum Bit-Fields Union - variables with Shared Memory	Example union 1/2 • A union composed of variables of the types: char, int, and double		
We can pass/return the struct itself void print_record(struct record rec) { printf("record: number(%d), value(%lf)\n", rec.number, rec.value); }	 Union is a set of members, possibly of different types All the members share the same memory <i>Members are overlapping</i> The size of the union is according to the largest member Union is similar to the struct and particular members can be 	<pre>1 int main(int argc, char *argv[]) 2 { 3 union Numbers { 4 char c; 5 int i; 6 double d; 7 }; 8 printf("size of char %lu\n", sizeof(char)); </pre>		
<pre>or as a pointer to a structure void print_item(item *v) { printf("item: n(%d), v(%lf)\n", v->n, v->v); } Passing the structure by</pre>	<pre>accessed using . or -> for pointers The declaration, union tag, and type definition is also similar to the struct union Nums { char c; int i; 4; };</pre>	<pre>9 printf("size of int %lu\n", sizeof(int)); 10 printf("size of double %lu\n", sizeof(double)); 11 printf("size of Numbers %lu\n", sizeof(double)); 12 union Numbers numbers; 13 union Numbers numbers; 14 printf("Numbers c: %d i: %d d: %lf\n", numbers.c, numbers.i, numbers.d); ■ Example output:</pre>		
 value, a new variable is allocated on the stack and data are copied Be aware of shallow copy of pointer data fields. pointer only the address is passed to the function lec05/struct.c 	5 Nums nums; /* THIS IS NOT ALLOWED! Type Nums is not known! */ 6 union Nums nums;	<pre>EXample Output: size of char 1 size of int 4 size of double 8 size of Numbers 8 Numbers c: 48 i: 740313136 d: 0.000000 lec05/union.c</pre>

Structures - struct Unions Type definition	ion - typedef Enumerations - enum Bit-Fields	Structures - struct Unions Type definition - typedef Enumerations - enum Bit-Fields	Organization of Source Files Preprocessor Building Programs		
Bit-Fields Memory Representa	ation	Bit-Fields Example			
 The way how a compiler handle bit-fields depends on the notion of the storage units Storage units are implementation defined (e.g., 8 bits, 16 bits, etc.) We can omit the name of the bit-field for padding, i.e., to ensure other bit fields are properly positioned 		<pre>typedef struct { unsigned int seconds: 5; unsigned int minutes: 6; unsigned int hours: 5; } file_time_int_s; void print_time(const file_time_s *t) { printf("%02u:%02u\n", t->hours, t->minutes, t-> seconds); </pre>	Part II Preprocessor and Building Programs		
<pre>typedef struct { unsigned int seconds: 5; unsigned int minutes: 6; unsigned int hours: 5; } file_time_int_s; // size 4 bytes printf("Size %lu\n", sizeof(file_time_int_s));</pre>	<pre>typedef struct { unsigned int seconds: 5; unsigned int minutes: 6; unsigned int hours: 5; } file_time_int_skip_s; // size 8 bytes because of padding printf("Size %lu\n", sizeof(file_time_int_skip_s));</pre>	<pre>} int main(void) { file_time_s time = { // designated initializers .hours = 23, .minutes = 7, .seconds = 10 }; print_time(&time); time.minutes += 30; print_time(&time); // size 2 bytes (for 16 bit short printf("Size of file_time_s %lu\n", sizeof(time)); return 0; } leco5/bitfields.c</pre>
