# Automaton Creation [UPP09]

## Automaton

- Starting position (double circle)
- "Add Location" to add a position
- "Selection Tool" for naming the position
- "Add Edge" to add an edge, bend the edges with the mouse around the ends
- the lower table "Position" and "Description" for error analysis

# System Composition <sup>[UPP09]</sup>

## System

- **System** ... a network of parallel timed automata (processes).
- **Process** ... an instance of a parameterized pattern.

## Process

- **Position** ...
  - name,
  - invariants
- **Edges** ...
  - guard conditions ( $x \geq 7$ ),
  - synchronization ( $go[id]?$ ),
  - assignment ( $x = 0$ ),

# System Composition <sup>[UPP09]</sup>

## System

- **System** ... a network of parallel timed automata (processes).

# System Description <sup>[UPP09]</sup>

The screenshot shows the UPPAAL tool interface. On the left is a project tree with the following structure:

- Project
  - Declarations
  - Train
    - Declarations
  - Gate
    - Declarations
  - System declarations

The main editor window displays the following code:

```

/*
 * For more details about this example, see
 * "Automatic Verification of Real-Time Communicating Systems by Constraint Solving",
 * by Wang Yi, Paul Pettersson and Mats Daniels. In Proceedings of the 7th International
 * Conference on Formal Description Techniques, pages 223-238, North-Holland, 1994.
 */

const int N = 6;          // # trains
typedef int[0,N-1] id_t;

chan      appr[N], stop[N], leave[N];
urgent chan go[N];
  
```

At the bottom of the editor, there is a table with two columns: Position and Description.

## Global Declarations

- global integer variables,
- global clock,
- synchronization channels,
- constants

# System Definitions <sup>[UPP09]</sup>

```
pool activated1, activated2;  
urgent chan pushed1, pushed2;  
urgent chan closed1, closed2;  
  
Door1 = Door(activated1, pushed1, closed1, closed2);  
Door2 = Door(activated2, pushed2, closed2, closed1);  
User1 = User(activated1, pushed1);  
User2 = User(activated2, pushed2);  
  
system Door1, Door2, User1, User2;
```

## Process Assignment

- a process instance declaration,
- patterns with fully/partially specified parameters,

## System Definition

- a list of system processes,

# System Definitions <sup>[UPP09]</sup>

```
pool activated1, activated2;  
urgent chan pushed1, pushed2;  
urgent chan closed1, closed2;  
  
Door1 = Door(activated1, pushed1, closed1, closed2);

# Transitions between Configurations in Kripke's structure <sup>[Voj10]</sup>

# Path in Kripke's structure <sup>[Voj10]</sup>

## Path

- **Path**  $\pi \dots$  in Kripke's structure  $M$  is an infinite sequence of states  $\pi = s_0s_1s_3 \dots$  such that,  $\forall i \in N..R(s_i, s_{i+1})$ .
- $\Pi(M, s) \dots$  a set of all paths in  $M$  that start in  $v s \in S$
- Suffix  $\pi^i$  of the path  $\pi = s_0s_1s_3 \dots s_i s_{i+1} s_{i+2}$  is a the path  $\pi^i = s_i s_{i+1} s_{i+2}$  starting in  $s_i$ .
- $s_i = \pi[i]$

# Concept of Time <sup>[Voj10]</sup>

## Time Abstraction

- **Logical time** ... works with (*partial*) ordering of states/events in system behavior.
- **Physical time** ... *measurement* of time elapsed between two states/events.

## Time in Model Verification

- **Linear time** ... allows you to express only about a given *linear path* in state space.
  - On all paths,  $x$  must be followed by  $y$ .
  - On all paths,  $x$  must be followed by  $y$  or  $z$ .
- **Branching time** ... allows to quantify (existentially and universally) possible futures starting with a given state. The state space is observed as an expanded *infinite tree*.
  - There is a path where the following next state is  $x$ .

# Computation Tree <sup>[Voj10]</sup>

Describes the properties of the processing progress.

# CTL\* Formula [Voj10]

## Consists of

- atomic statements
- logical connectors
- path quantifiers
- temporal operators

# CTL\* Quantifiers and Operators [Wik10, Voj10]

## Path Quantifiers

describe the branching structure of a computation tree

- $E$  ... there exists a processing path from the given state.
- $A$  ... for all processing paths from the given state.

## Temporal Operators

determine the properties of a given path in the computation tree

- $X\varphi$  (next time,  $\bigcirc$ ) ... the property  $\varphi$  is fulfilled in the second (next) state of the path.

- $F\varphi$  (in future,  $\diamond$ ) ... the property  $\varphi$  is valid in a state of the path.

# CTL\* Quantifiers and Operators [Wik10, Voj10]

## Path Quantifiers

describe the branching structure of a computation tree

- $E$  ... there exists a processing path from the given state.
- $A$  ... for all processing paths from the given state.

## Temporal Operators

determine the properties of a given path in the computation tree

- $X\varphi$  (next time,  $\bigcirc$ )... the property  $\varphi$  is fulfilled in the second (next) state of the path.

- $F\varphi$  (in future,  $\diamond$ )... the property  $\varphi$  is valid in a state of the path.

# CTL\* Operators [Wik10, Voj10]

## Temporal Operators

- $G\varphi$  (globally,  $\Box$ )... The property  $\varphi$  is satisfied in all states of the given path.

- $\psi U\varphi$  (until)... The property  $\varphi$  is valid in some path state, and the property  $\psi$  is valid at least in all previous states of this path.

- $\psi R\varphi$  (release)... The property  $\varphi$  must be valid until (and including) the state when the  $\psi$  property becomes satisfied, if such a state exists.

# CTL\* Syntax <sup>[Voj10]</sup>

Let  $AP$  be a nonempty set of atomic propositions.

## Syntax of **state formulas** that are true in a given state

- If  $p \in AP$ , then  $p$  is a state formula.
- If  $\varphi$  and  $\psi$  are state formulae, then  $\neg\varphi$ ,  $\varphi \vee \psi$ ,  $\varphi \wedge \psi$  are state formulae.
- If  $\varphi$  is a path formula, then  $E\varphi$  and  $A\varphi$  are state formulae.

## Syntax of **path formulae** that are true in states along a specific path

- If  $\varphi$  is a state formula, then  $\varphi$  is also a path formula.
- If  $\varphi$  and  $\psi$  are path formulae, then  $\neg\varphi$ ,  $\varphi \vee \psi$ ,  $\varphi \wedge \psi$ ,  $X\varphi$ ,  $F\varphi$ ,  $G\varphi$ ,  $\varphi U\psi$  and  $\varphi R\psi$  are path formulae.

CTL\* is the set of state formulae generated by the above rules.

# CTL\* Syntax <sup>[Voj10]</sup>

Let  $AP$  be a nonempty set of atomic propositions.

## Syntax of **state formulas** that are true in a given state

- If  $p \in AP$ , then  $p$  is a state formula.
- If  $\varphi$  and  $\psi$  are state formulae, then  $\neg\varphi$ ,  $\varphi \vee \psi$ ,  $\varphi \wedge \psi$  are state formulae.

- Let be Kripke's structure  $M = (S, T, \mathcal{I}, s_0, L)$  over a set of atomic propositions  $AP$ .
- For the state formula  $\varphi$  over  $AP$ , we denote  $M, s \models \varphi$  the fact, that  $\varphi$  is satisfied in  $s \in S$ .
- For the path formula  $\varphi$  over  $AP$ , we denote  $M, \pi \models \varphi$  the fact, that  $\varphi$  is satisfied along the path  $\pi$  in  $M$ .
- Let  $s \in S$ ,  $\pi$  be a path in  $M$ ,  $\varphi_1, \varphi_2$  are state formulae over  $AP$ ,  $p \in AP$ , and  $\psi_1, \psi_2$  are path formulae over  $AP$ .  
Then, we define a relation  $\models$  inductively as follows:
  - $M, s \models p$  iff  $p \in L(s)$ .
  - $M, s \models \neg\varphi_1$  iff  $M, s \not\models \varphi_1$ .
  - $M, s \models \varphi_1 \vee \varphi_2$  iff  $M, s \models \varphi_1$  or  $M, s \models \varphi_2$ .
  - $M, s \models \varphi_1 \wedge \varphi_2$  iff  $M, s \models \varphi_1$  and  $M, s \models \varphi_2$ .
  - $M, s \models E\psi_1$  iff  $\exists \pi \in \Pi(M, s). M, \pi \models \psi_1$ .
  - $M, s \models A\psi_1$  iff  $\forall \pi \in \Pi(M, s). M, \pi \models \psi_1$ .

# CTL\* Path Semantics <sup>[Voj10]</sup>

- To continue defining the relation  $\models$ :

# LTL Syntax <sup>[Voj10]</sup>

- LTL is a sublogic of CTL\*
  - It only allows formulas of the form  $A\varphi$ , in which state subformulae are atomic propositions.
  - LTL formula is created according to the following grammar:
    - $\varphi ::= A\psi$  ( $A$  is often omitted)
    - $\psi ::= p \mid \neg\psi \mid \psi \vee \psi \mid \psi \wedge \psi \mid X\psi \mid F\psi \mid G\psi \mid \psi U \psi \mid \psi R \psi$ ,
    - where  $p \in AP$ .
  - LTL provides expressions about specific paths in a given Kripke's structure
    - i.e. ignores branching

# LTL, CTL, CTL\* [Voj10]

- LTL and CTL cannot be compared:
  - For example, CTL cannot express the LTL formula  $A(FGp)$
  - For example, LTL cannot express the CTL formula  $AG(EFp)$
- CTL\* covers both LTL and CTL
  - disjunction  $(A(FGp)) \vee (AG(EFp))$  cannot be expressed in either LTL or CTL.

# Conditions over clocks <sup>[BDL05]</sup>

- $C$  ... clock set
- $B(C)$  ... a set of conjunctions over simple conditions of type
  - $x \bowtie c$
  - $x - y \bowtie c$
  - where
    - $x, y \in C$ ,
    - $c \in \mathbb{N}$ ,
    - $\bowtie \in \{<, \leq, =, \geq, >\}$

# Query Language <sup>[BDL05]</sup>

- **State formulae** ... describe individual states.
- **Path formulae** ... are evaluated along model paths and traces.
  - reachability,
  - safety,
  - liveness.

# State Formulae <sup>[BDL05]</sup>

- an expression that can be evaluated for a given state without having to analyze the behavior of the model.
- a superset of guards, i.e. it has no side effect,
- unlike guards, the use of disjunctions is not limited.
- Test whether the process is in the given position ...  $P.l$ 
  - $P$  ... process
  - $l$  ... position
- **deadlock** ...
  - a special state formula, which is fulfilled for all blocked states,
  - A state is blocked if there is no action transition from that state or any delayed state successor.

  - Trains Crossing a Bridge
  - Game NIM
    - Game Requirements Specification NIM

# Reachability <sup>[BDL05]</sup>

- the simplest feature,
- asks if there is a possibility that the given state formula  $\varphi$  is satisfied in every reachable state.
- i.e. there is a path from the initial state such that  $\varphi$  will be fulfilled once along this path.
- check the basic properties of the model
  - that at least the basic behavior can be achieved,
  - an example of a communication protocol with one transmitter and one receiver
    - it is possible to send a message by transmitter at all.
    - The message is eventually received by the receiver.
- in UPPAAL:  $E\langle\rangle\varphi$

# Safety <sup>[BDL05]</sup>

- anything bad will never happen
- an example of a nuclear power plant model
  - the operating temperature is always (invariantly) below a certain threshold,
  - the container will never melt
- a variant: something is not possible to happen at all
- an example of playing a game
  - The safe state is that if we can still play the game, then there is no way to lose it.
- in UPPAAL:
  - is formulated positively
  - let  $\varphi$  be a state formula
  - $A[\Box]\varphi \equiv \neg E\Diamond\neg\varphi \dots \varphi$  should be true in all reachable states
  - $E[\Box]\varphi \dots$  there is a path along which  $\varphi$  is always true

- something will eventually happen one day
- examples
  - pressing the *on* button on the remote control will cause the TV to turn on once.
  - in the communication protocol model:  
any message sent will be received eventually.
- in UPPAAL:
  - $A\langle\rangle\varphi \equiv \neg E\Box\neg\varphi \dots \varphi$  will always be fulfilled eventually,
  - $\varphi \dashrightarrow\psi \equiv A\Box(\varphi \Rightarrow A\Diamond\psi) \dots$   
whenever  $\varphi$  is fulfilled, then  $\psi$  will be met eventually.

  - Game NIM
    - Game Requirements Specification NIM

# Observer <sup>[BDL05]</sup>

- an additional automaton
- detects events without having to change the model itself.

## Example

- clock reset detection
- extra clock reset ( $x := 0$ )

## Initial Variant of Example [BDL05]

```
// Place global declarations here.
clock x;
chan reset;
```

```
// Place template instantiations here.
p1 = P1();
obs = Obs();

// List one or more processes to be comp
system p1, obs;
```

- The goal is to stay in position if the (invariant) condition on the clock applies and then leave the position.
- Option 1: no invariant

# 1. Variant of the Example <sup>[BDL05]</sup>

- The goal is to stay in position if the (invariant) condition on the clock applies and then leave the position.
- Option 1: no invariant
- $A[] \text{ obs.taken} \text{ imply } x \geq 2$
- $E\langle \rangle \text{ obs.idle} \text{ and } x > 3$

## 2. Variant of the Example <sup>[BDL05]</sup>

- The goal is to stay in position if the (invariant) condition on the clock applies and then leave the position.
- Option 2: with invariant
- $A[]$  obs.taken imply  $(x \geq 2$  and  $x \leq 3)$
- $E\langle\rangle$  obs.idle and  $x > 2$ 
  - $E\langle\rangle$  obs.idle and  $x > 3$  ... is not satisfied
- $A[]$  obs.idle imply  $x \leq 3$

### 3. Variant of the Example <sup>[BDL05]</sup>

$x \geq 2$  and  $x \leq 3$   
reset!

- The goal is to stay in position if the (invariant) condition on the clock applies and then leave the position.
- Option 3: without invariant with guards
- A[]  $x > 3$  imply not obs.taken ... deadlock occurs
- A[] not deadlock ... is not satisfied

## 4. Variant of the Example <sup>[BDL05]</sup>

- The goal is to stay in position if the (invariant) condition on the clock applies and then leave the position.
- Option 4: without invariant with equality guards
- A[]  $x > 2$  imply not obs.taken ... deadlock occurs
- A[] not deadlock ... is not satisfied

## 5. Variant of the Example <sup>[BDL05]</sup>

- The goal is to stay in position if the (invariant) condition on the clock applies and then leave the position.
- Option 5: with invariant and with equality guards
- $A[] \text{ obs.taken} \text{ imply } x == 2$
- $E\langle \rangle \text{ obs.idle and } x > 2 \dots$  is not satisfied
- $A[] \text{ obs.idle} \text{ imply } x \leq 2$

# Example 1, processes $P, Q$ [Dav05]

- The goal is to make the sync transition as soon as possible.
- i.e. as soon as both  $P$  and  $Q$  automata are ready (simultaneously in positions  $l_1$  and  $s_1$ ).
- How to choose a model when they get into positions at different time instants?

# Example 1, processes $P, Q, X3$ [Dav05]

- The goal is to make the sync transition as soon as possible.
- i.e. as soon as both  $P$  and  $Q$  automata are ready (simultaneously in positions  $l_1$  and  $s_1$ ).
- How to choose a model when they get into positions at different time instants?
- **Solution:** urgent chan a

# Example 1, processes $P, Q, X3$ [Dav05]

- The goal is to make the sync transition as soon as possible.
- i.e. as soon as both  $P$  and  $Q$  automata are ready (simultaneously in positions  $l_1$  and  $s_1$ ).
- How to choose a model when they get into positions at different time instants?
- **Solution:** urgent chan a

# Example 2, processes $P, Q, X3$ [Dav05]

- The goal is to make a transition with the condition  $i == 5$  once it is met..

# Example 2, processes $P, Q, R, X3$ [Dav05]

- The goal is to make the transition with the condition  $i == 5$  as soon as possible.
- i.e. as soon as both  $P$  and  $Q$  automata are ready (simultaneously in positions  $l_1$  and  $s_1$ ).
- How to choose a model when they get into positions at different time instants?
- **Solution:**
- urgent chan go
- another process that emits an action  $go!$

# Example 2, processes $P, Q, R, X3$ [Dav05]

- The goal is to make the transition with the condition  $i == 5$  as soon as possible.
- i.e. as soon as both  $P$  and  $Q$  automata are ready (simultaneously in positions  $l_1$  and  $s_1$ ).
- How to choose a model when they get into positions at different time instants?
- **Solution:**
- urgent chan go
- another process that emits an action  $go!$

# Urgent Channels <sup>[Dav05]</sup>

- urgent chan hurry
- **Semantics:**
- There is no delay if an edge with an urgent action can be executed.
- 
- **Restrictions:**
  - No clock guards are allowed on the edges of the urgent action.
  - Invariants and guards on data variables are allowed.

# Urgent Position using Clocks [Dav05]

- Suppose we model a simple system  $M$  that accepts packages on channel  $a$  and immediately sends them to channel  $b$
- $P_1$  models the system using the clock  $x$

# Urgent Position <sup>[Dav05]</sup>

- Suppose we model a simple system  $M$  that accepts packages on channel  $a$  and immediately sends them to channel  $b$
- $P_2$  models the system using an urgent position
- $P_1$  and  $P_2$  have the same behavior

# Urgent Position <sup>[Dav05]</sup>

- **Semantics:**

- There is no delay in the urgent position.

- **Note:**

- Using urgent positions **reduces** the number of clocks in the model and thus the complexity.

Example Idea <sup>[BDL05]</sup>

# Example Specifications <sup>[BDL05]</sup>

## Textual Specifications

- Bridge access control for several trains.
- A bridge as a critically shared resource can only be crossed by one train.
- The system is defined as several trains and a controller.
- The train cannot be stopped immediately, it also takes time to start.

# Timing and Communication

[BDL05]

## Time constraints and communication

- The train sends a **appr!** signal on time when it arrives at the bridge.
- Then the train has 10 time units to receive a stop signal,
  - this allows a safe stop in front of the bridge.
- After these 10 time units, it takes another 10 units for the train to reach the bridge if it is not stopped.
- If the train is stopped, the train will start after it receives the **go!** signal from the bridge controller.
- When the train leaves the bridge, it sends a signal **leave!**.

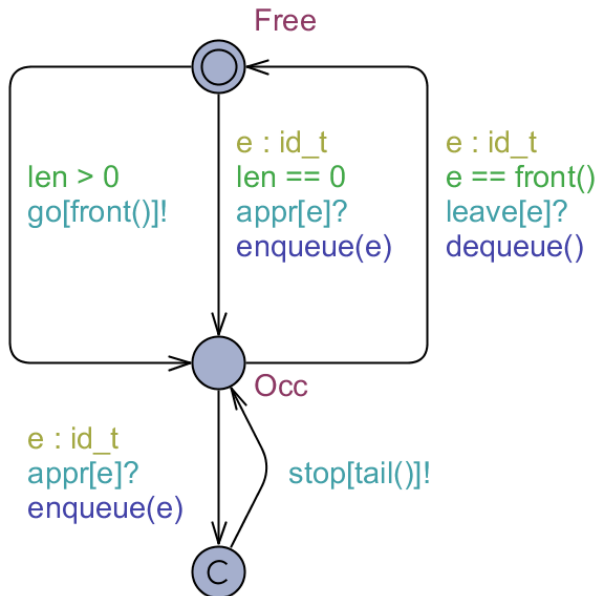

## Synchronization Signals [BDL05]

## Train Template [BDL05]

# Bridge Controller Template <sup>[BDL05]</sup>

# Model Verification <sup>[BDL05]</sup>

- $E \langle \rangle \text{Gate.Occ}$

# Simple Variant NIM

## The Nim Number Game

Whoever takes the last proton wins!

Press the "I'm ready! Let's start!" button to begin!

- NIM is a game based on logic and strategy.
- 2 players are playing.
- The player removes one to  $MAX$  (2) items (matches, protons) from the series during his turn.
- The player who removes the last thing wins.

# Classic Variant NIM

- NIM is a game based on logic and strategy.
- 2 players are playing.
- The players remove objects from different piles/rows.
- The player must remove at least one object during his turn.
- On his turn, the player removes any number of objects, all of which belong to one pile.
- Basic variants of the game:
  - **Normal** ... The player who removes the last thing wins.
  - **Loss** ... The player who removes the last thing loses.
