

# The complexity of different algorithms varies

An algorithm is not a program

## The speed...

One algorithm (program, method...)  
is **faster** than another one.

What do we mean by this statement??

## Asymptotic complexity

Each algorithm can be unambiguously assigned

**growing function**

named

**asymptotic complexity**

which characterizes the number of algorithm operations with respect to the growing size of input data.

**The slower this function grows the faster the algorithm.**

# Asymptotic complexity

$Y \sim$  system load  
(computing time)

$x \sim$  our demands  
(input data size)

## Examples

Find min and max value in an array — STANDARD

```
if (a[i] < min) min = a[i];  
if (a[i] > max) max = a[i];
```

## Examples

Find min and max value in an array — STANDARD

min	max	a
2	7	3 2 7 10 0 5 -10 4 6

etc...

done	min	max	a
	-10	10	3 2 7 10 0 5 -10 4 6

code

```
min = a[0]; max = a[0];
for ( i = 1; i < a.length; i++) {
    if (a[i] < min) min = a[i];
    if (a[i] > max) max = a[i]; }

```

Examples 

Find min and max value in an array — FASTER!

```

if (a[i] < a[i+1]) {
    if (a[i] < min) min = a[i];
    if (a[i+1] > max) max = a[i+1];
}

```

## Examples

Find min and max value in an array — FASTER!

min	max	a
2	7	3 2 7 10 0 5 -10 4 6

```

if (a[i] < a[i+1]) {
    if (a[i] < min) min = a[i];
    if (a[i+1] > max) max = a[i+1];
}
else {
    if (a[i] > max) max = a[i];
    if (a[i+1] < min) min = a[i+1];
}

```

min	max	a
0	10	3 2 7 10 0 5 -10 4 6

## Examples

Find min and max value in an array — FASTER!

done

min	max	a										
-10	10	3	2	7	10	0	5	-10	4	6		

↓

code

```

min = a[0]; max = a[0];
for (i=1; i < a.length-1; i=i+2 ) {
    if (a[i] < a[i+1]) {
        if ( a[i] < min) min = a[i];
        if (a[i+1] > max) max = a[i+1];}
    else {
        if ( a[i] > max) max = a[i];
        if (a[i+1] < min) min = a[i+1];}}

```

## Computing the complexity

### Elementary operation

arithmetic operation  
comparison of two numbers  
number move in the memory

### Complexity

**A**

a total number of elementary operations

simplification

### Complexity

**B**

a total number of elementary operations on data

## Computing the complexity

**B**  
Complexity

a total number of elementary operations on data

another  
simplification

**C**  
Complexity

a total number of number  
(or character) comparisons on the data

The most common way of computing the complexity

# Computing the complexity

Find min and max value in an array — STANDARD

**A**

Complexity

All operations

case

best

worst

```

    1           1           a.length = N
    min = a[0]; max = a[0];
    for ( i = 1; i < a.length; i++) {
        if (a[i] < min) min = a[i];
        if (a[i] > max) max = a[i]; }
    
```

$$1 + 1 + 1 + N + N - 1 + N - 1 + 0 + N - 1 + 0 = 4N$$

$$1 + 1 + 1 + N + N - 1 + N - 1 + N - 1 + N - 1 + N - 1 = \underline{\underline{6N - 2}}$$

# Computing the complexity

Find min and max value in an array — STANDARD

**B**

Complexity

operations on data

case

best

worst

```

min = a[0]; max = a[0];
for ( i = 1; i < a.length; i++ ) {
    if ( a[i] < min ) min = a[i];
    if ( a[i] > max ) max = a[i]; }
    
```

Annotations in the code block:   
 - Green boxes with '1' point to the initialization of min and max.   
 - A green box with 'a.length = N' is on the right.   
 - Dashed boxes are around the loop condition.   
 - Green boxes with 'N-1' point to the loop increment and the first if statement.   
 - Green boxes with '0...N-1' point to the array access in both if statements.

$$1 + 1 + N - 1 + 0 + N - 1 + 0 = 2N$$

$$1 + 1 + N - 1 + N - 1 + N - 1 + N - 1 = \underline{\underline{4N - 2}}$$

## Computing the complexity

Find min and max value in an array — FASTER!

Complexity **C**

only tests  
on data

```

a.length = N
min ≙ a[0]; max ≙ a[0];
for ( i ≙ 1; i < a.length; i++ ) {
    if ( a[i] < min ) min ≙ a[i];
    if ( a[i] > max ) max ≙ a[i]; }

```

Diagram annotations: Dashed boxes above the code indicate the number of comparisons. For the first line, two boxes above 'a[0]' indicate two comparisons. For the for loop, boxes above 'i < a.length' and 'i++' indicate one comparison each. For the if statements, boxes above '<' and '>' indicate one comparison each. Two green boxes labeled 'N-1' with arrows point to the '<' and '>' comparisons in the if statements, indicating they occur N-1 times.

always

## Examples

### Data

array a:

1	-1	0	-2	5	1	0
---	----	---	----	---	---	---

array b:

4	2	4	3	4	2	7
---	---	---	---	---	---	---

### Problem

How many elements of array b are equal to the sum of all elements of array a?

### Solution

array a:

1	-1	0	-2	5	1	0
---	----	---	----	---	---	---

sum = 4

array b:

4	2	4	3	4	2	7
---	---	---	---	---	---	---

result = 3

## Examples

function

```
int sumArr(int[] a) { /* easy */ }
```

```
count = 0;
for (int i = 0; i < b.length; i++)
    if (b[i] == sumArr(a)) count++;
return count;
```

**SLOW**  
method

```
count = 0;
sumOf_a = sumArr(a);
for (int i = 0; i < b.length; i++)
    if (b[i] == sumOf_a) count++;
return count;
```

**FAST**  
method

# Computing the complexity

**SLOW method**

array a:

etc:...  $e(1000) = 9843181236605408906547628704342.9$

$p(1000) = 62506.25 \dots$

## Functions' order of growth

## Functions' order of growth

$\Omega(f(x))$

$\Omega$  Omega

The set  $\Omega(f(x))$   
contains every function  $g(x)$  which from some point  $x_0$  on  
(and the position of  $x_0$  is completely arbitrary)

a) – has always bigger value than function  $f(x)$  OR

b) – has not bigger value than  $f(x)$ , however  
after being multiplied by some positive constant  
(the constant value is arbitrary as well)  
has always bigger value than function  $f(x)$ .

Thus: if we find some  $x_0$  and  $c > 0$  such that  
 $c \cdot g(x) > f(x)$  everywhere to the right of  $x_0$   
(sometimes  $c=1$  is enough), then surely  $g(x) \in \Omega(f(x))$

## Functions' order of growth

Thus: if we find some  $x_0$  and  $c > 0$  such that  $c \cdot g(x) > f(x)$  everywhere to the right of  $x_0$  (sometimes  $c=1$  is enough), then surely  $g(x) \in \Omega(f(x))$

$x > 60 \Rightarrow e(x) > p(x)$ , i.e.  $1.072(x+26.44) > \frac{1}{16}(x^2+100)$

hence holds  $e(x) \in \Omega(p(x))$  (check it!)

## Functions' order of growth

Thus: if we find some  $x_0$  and  $c > 0$  such that  $c \cdot g(x) > f(x)$  everywhere to the right of  $x_0$  (sometimes  $c=1$  is enough), then surely  $g(x) \in \Omega(f(x))$

$$b(x) = x + 3\sqrt{x}$$

$$r(x) = x - 1$$

$x > 3.1 \Rightarrow 4 \cdot r(x) > b(x)$ , i.e.  $4(x-1) > x + 3\sqrt{x}$  (check it!)

hence holds  $r(x) \in \Omega(b(x))$

## Functions' order of growth

### Typical examples

$$x^2 \in \Omega(x)$$

$$x^3 \in \Omega(x^2)$$

$$x^{n+1} \in \Omega(x^n)$$

$$2^x \in \Omega(x^2)$$

$$2^x \in \Omega(x^3)$$

$$2^x \in \Omega(x^{5000})$$

$$x \in \Omega(\log(x))$$

$$x \cdot \log(x) \in \Omega(x)$$

$$x^2 \in \Omega(x \cdot \log(x))$$

$$2^x \in \Omega(x^{20000})$$

$$x^{20000} \in \Omega(x)$$

$$x \in \Omega(1)$$

always

$$f(x) > 1 \Rightarrow f(x) \in \Omega(1)$$

hard to believe

$$x^{200\,000} \in \Omega(\log(x)^{200\,000})$$

## Functions' order of growth

**Caution! The picture is not exact, it is a mere illustration.**

## Functions' order of growth

$O(f(x))$

**O Omicron**

The set  $O(f(x))$  contains each function  $g(x)$  which from some point  $x_0$  on (and the position of  $x_0$  is completely arbitrary)

- a) – has always smaller value than function  $f(x)$
- b) – has not smaller value than  $f(x)$ , however after being multiplied by some positive constant ( $< 1$  😊) (the constant value is arbitrary as well) has always smaller value than  $f(x)$ .

Thus: if we find some  $x_0$  and  $c > 0$  such that  $c \cdot g(x) < f(x)$  everywhere to the right of  $x_0$ , (sometimes  $c=1$  suffices) then surely,  $g(x) \in O(f(x))$

## Functions' order of growth

Thus: if we find some  $x_0$  and  $c > 0$  such that  $c \cdot g(x) < f(x)$  everywhere to the right of  $x_0$ , (sometimes  $c=1$  suffices) then surely,  $g(x) \in O(f(x))$

$x > 60 \Rightarrow p(x) < e(x)$ , i.e.  $\frac{1}{16}(x^2+100) < 1.072^{(x+26.44)}$

hence holds  $p(x) \in O(e(x))$

(check it!)

## Functions' order of growth

Thus: if we find some  $x_0$  and  $c > 0$  such that  $c \cdot g(x) < f(x)$  everywhere to the right of  $x_0$ , (sometimes  $c=1$  suffices) then surely,  $g(x) \in O(f(x))$

$$b(x) = x + 3\sqrt{x}$$

$$r(x) = x - 1$$

$$\begin{array}{l} \xrightarrow{\text{green arrow}} \\ x > 1 \end{array} \Rightarrow r(x) < b(x), \text{ i.e. } \quad x - 1 < x + 3\sqrt{x}$$

hence holds  $r(x) \in O(b(x))$

## Functions' order of growth

$$f \in \Omega(g) \iff g \in O(f)$$

$$x \in O(x^2)$$

$$x^2 \in O(x^3)$$

$$x^n \in O(x^{n+1})$$

$$x^2 \in O(2^x)$$

$$x^3 \in O(2^x)$$

$$x^{5000} \in O(2^x)$$

$$\log(x) \in O(x)$$

$$x \in O(x \cdot \log(x))$$

$$x \cdot \log(x) \in O(x^2)$$

$$x^{20000} \in O(2^x)$$

$$x \in O(x^{20000})$$

$$1 \in O(x)$$

always

$$f(x) > 1 \implies 1 \in O(f(x))$$

hard to believe

$$\log(x)^{200\,000} \in O(\sqrt[200\,000]{x})$$

## Functions' order of growth

## Functions' order of growth

$$\Theta(f(x)) = \Omega(f(x)) \cap O(f(x))$$

### $\Theta$ Theta

The set  $\Theta(f(x))$  contains every function  $g(x)$  which belongs to both  $\Omega(f(x))$  and  $O(f(x))$ .

$$f(x) \in \Theta(g(x)) \iff g(x) \in \Theta(f(x))$$

## Functions' order of growth

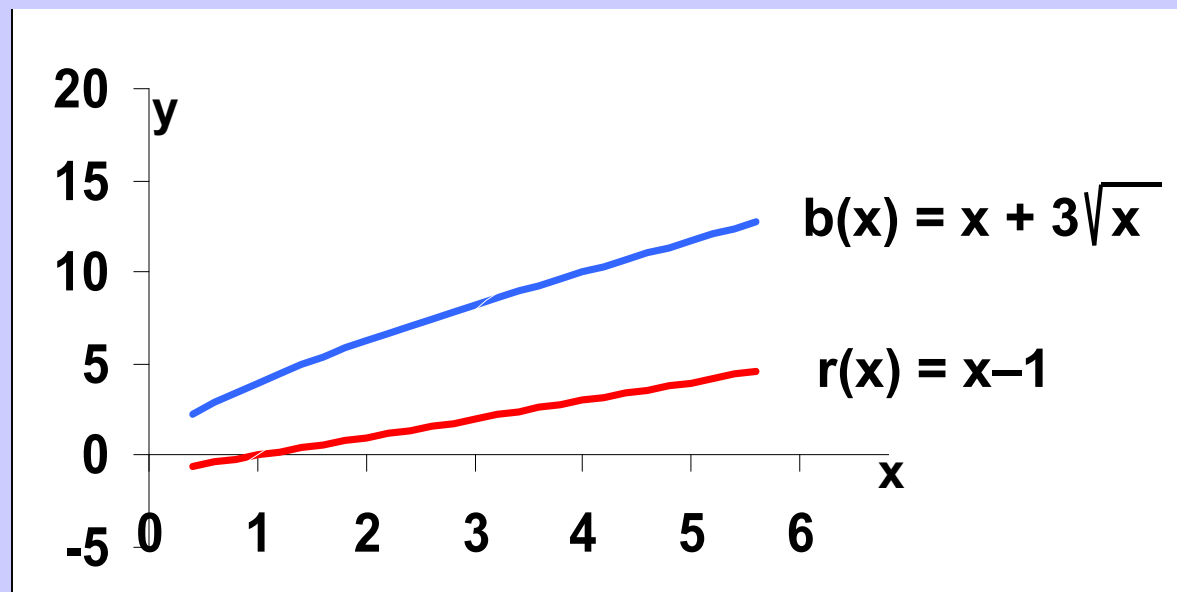

$$f(x) \in \Theta(g(x)) \iff g(x) \in \Theta(f(x))$$

$$b(x) = x + 3\sqrt{x}$$

$$r(x) = x - 1$$

$$r(x) \in \Omega(b(x))$$

$$r(x) \in O(b(x))$$

$$r(x) \in \Theta(b(x))$$

$$b(x) \in \Theta(r(x))$$

## Functions' order of growth

### Rules

1.  $(a > 0) \Leftrightarrow \Theta(f(x)) = \Theta(a \cdot f(x))$
2.  $g(x) \in O(f(x)) \Leftrightarrow \Theta(f(x)) = \Theta(f(x) + g(x))$

### In words

1. Multiplication by positive constant does not affect belonging to  $\Theta(f(x))$ .
2. Addition or subtraction of a „smaller“ function does not affect belonging to  $\Theta(f(x))$ .

### Examples

$$1.8x + 600 \cdot \log_2(x) \in \Theta(x)$$

$$x^3 + 7x^{1/2} + 5(\log_2(x))^4 \in \Theta(x^3)$$

$$13 \cdot 3^x + 9x^{12} + 42x^{-4} + 29 \in \Theta(3^x)$$

$$4 \cdot 2^n + 3 \cdot 2^{n-1} + 5 \cdot 2^{n/2} \in \Theta(2^n)$$

$$0.1x^5 + 200x^4 + 7x^2 - 3 \in \Theta(x^5)$$

$$\text{---} \in O(x^5)$$

$$\text{---} \in \Omega(x^5)$$

## Functions' order of growth

$$\Omega(f(x)) = \{ g(x) ; \exists x_0 > 0, c > 0 \forall x > x_0 : c \cdot f(x) < g(x) \}$$

$$O(f(x)) = \{ g(x) ; \exists x_0 > 0, c > 0 \forall x > x_0 : g(x) < c \cdot f(x) \}$$

$$\Theta(f(x)) = \{ g(x) ; \exists x_0 > 0, c_1 > 0, c_2 > 0 \forall x > x_0 : c_1 \cdot f(x) < g(x) < c_2 \cdot f(x) \}$$

**Caution! The pictures are not exact, they are mere illustration.**

## Functions' order of growth

### Comparing the speed of growth of functions

Function  $f(x)$  grows asymptotically faster than function  $g(x)$  when

$$f(x) \in \Omega(g(x)) \ \& \ f(x) \notin \Theta(g(x))$$

Be careful!

### Comparing the speed of algorithms

Algorithm A is asymptotically slower than algorithm B when

$$f_A(n) \in \Omega(f_B(n)) \ \& \ f_A(n) \notin \Theta(f_B(n)),$$

where  $f_A(n)$ , resp.  $f_B(n)$  is a function determining the number of operations executed by algorithm A, resp. B when they process data of size  $n$ .

## Functions' order of growth

### Order of growth of a function

Order of growth of function  $f$   
is “the most simple” function  $g$ , for which holds  
 $g(x) \in \Theta(f(x))$

### Manipulation

The order of growth is mostly obtained by dropping

1. additive members of “slower or equal” rate of growth,
2. multiplicative constants.

### Examples

$ff(n) = 4 \cdot 2^n + 3 \cdot 2^{n-1} + 5 \cdot 2^{n/2} \in \Theta(2^n)$       order of growth is  $2^n$

$hh(x) = x + \log_2(x) - \sqrt{x} \in \Theta(x)$       order of growth is  $x$

## Asymptotic complexity

### Asymptotic complexity of an algorithm

**Asymptotic complexity of algorithm A is the order of growth of the function  $f(n)$  which characterizes maximum number of elementary operations which algorithm A performs when it processes any data of size  $n$ .**

**We suppose that the data are the most "difficult" ones.**

**(size of data = the total number of data elements)**

**Mostly it makes no difference if we consider**

- A) total of all elementary operations,**
- B) total of all elementary operations on data,**
- C) total of tests on data.**

**The asymptotic complexity is usually the same.**

## Asymptotic complexity

### Asymptotic complexity of the introductory examples

Searching for min and max in an array.  
Asymptotic complexity is  $\Theta(\underline{n})$  in both cases.

Checking how many elements are equal to sum of an array.  
Asymptotic complexity of the SLOW solution is  $\Theta(\underline{n^2})$ .  
Asymptotic complexity of the FAST solution is  $\Theta(\underline{n})$ .

Assuming both arrays are of length  $\underline{n}$ .

Asymptotic complexity of linear search in a sorted array is  $O(\underline{n})$ .  
Asymptotic complexity of binary search in a sorted array is  
 $O(\underline{\log(n)})$ .

Assuming the array is of length  $\underline{n}$ .

# Asymptotic complexity

## Conventions

### Simplification

Usually the term „algorithm complexity“  
is interpreted as „asymptotic complexity of the algorithm“.

### Confusion

Usually they do not say  $f(x)$  belongs to  $\Theta(g(x))$ ,

but rather  $f(x)$  is  $\Theta(g(x))$ .

And they mark it accordingly  $f(x) = \Theta(g(x))$

instead of  $f(x) \in \Theta(g(x))$ .

The same convention holds for  $O$  and  $\Omega$ .

But they think of it in the original meaning defined above.

## Asymptotic complexity

$$\in \Theta(\text{station wagon})$$

$$\in \Theta(\text{Formula 1 car})$$

$$\in \Omega(\text{Formula 1 car})$$

$$\in O(\text{station wagon})$$

# The complexity of different algorithms varies

An algorithm is not a program
