

Lecture 1: Introduction to Aerial Multi-Robot Systems

B3M33MRS — Aerial Multi-Robot Systems

Doc, Ing. Martin Saska, Dr. rer. nat.

Labs: Ing. Tomáš Báča, Ph.D

Multi-Robot Systems group, Faculty of Electrical Engineering
Czech Technical University in Prague

FACULTY
OF ELECTRICAL
ENGINEERING
CTU IN PRAGUE

MULTI-ROBOT
SYSTEMS
GROUP

Basic terminology

- UAVs – Unmanned Aerial Vehicles
- Drones
- UASs – Unmanned Aircraft Systems
- Aerial Robots
- RPAVs – Remotely Piloted Aerial Vehicles
- RPASs – Remotely Piloted Aircraft Systems

A drone is a male honey bee

UAVs = Drones Aerial Robots = Autonomous UAVs

UAS = UAV + ground control station, communication, dock, etc.

UAVs = Remotely Piloted Vehicles \cup Autonomous UAVs

Classification of Unmanned Aerial Vehicles

- Structure of airfoil and propulsion system
- Size and weight of UAVs (wingspan, size of the frame)
- Performance (e.g. High Altitude, Long Endurance (HALE))
- Application specified

Classification of Unmanned Aerial Vehicles

- **Structure of airfoil and propulsion system**
- Size and weight of UAVs (wingspan, size of the frame)
- Performance (e.g. High Altitude, Long Endurance (HALE))
- Application specified

- ✓ Fixed wing
- ✓ Rotary wing
- ✓ Hybrid (Vertical Take-Off and Landing (VTOL))
- ✓ Flapping wing

Towards fully autonomous aerial robots - basic terms

[Lecture 1 Introduction](#)

[Martin Saska](#)

[Basic terminology](#)

[Classification of UAVs](#)

[Towards autonomous UAVs](#)

[Autonomous UAV structure](#)

[Conclusion](#)

$\mathbf{r} = \begin{pmatrix} r_x \\ r_y \\ r_z \end{pmatrix}$ - position of the robot

φ, θ, ψ - Euler angles (yaw, pitch and roll)

$\omega_x, \omega_y, \omega_z$ - angular velocities

$\mathbf{x} = (r_x, r_y, r_z, \varphi, \theta, \psi)$ - configuration (state) of the robot for planning (week 4)

C - configuration space (C-space): the space of all robot configurations

O - set of obstacles

$A(\mathbf{x}) \subset W$ - geometry of the robot at a configuration \mathbf{x} in the world W

$C_{obs} = \{\mathbf{x} \in C \mid A(\mathbf{x}) \cap O \neq \emptyset\}$ - set of configurations, where the robot is in a collision

$C_{free} = C \setminus C_{obs}$ - free space (the space, where the robot can move)

$\mathbf{x} = (\mathbf{r}^T, \dot{\mathbf{r}}^T, \ddot{\mathbf{r}}^T, \varphi, \theta, \psi, \omega_x, \omega_y, \omega_z)$ - configuration (state) of the robot for state estimation (week 2)

$\mathbf{x} = (\mathbf{r}^T, \dot{\mathbf{r}}^T, \ddot{\mathbf{r}}^T, \ddot{\mathbf{r}}^T, \overset{\text{Jerk}}{\ddot{\varphi}}, \overset{\text{Snap}}{\ddot{\theta}}, \ddot{\psi}, \omega_x, \omega_y, \omega_z)$ - configuration (state) of the robot for control (week 2)

Source: S. Juan's archive

Towards fully autonomous aerial robots – necessary SW components

- State estimation and localization (week 3)
- **Control and motion planning** (week 2)
- Mapping (week 4)
- Planning (week 4)
- ✓ How to command motors
- ✓ Producing desired actions to reach a desired state
- ✓ PID, MPC, NMPC, End-to-End control using reinforcement learning

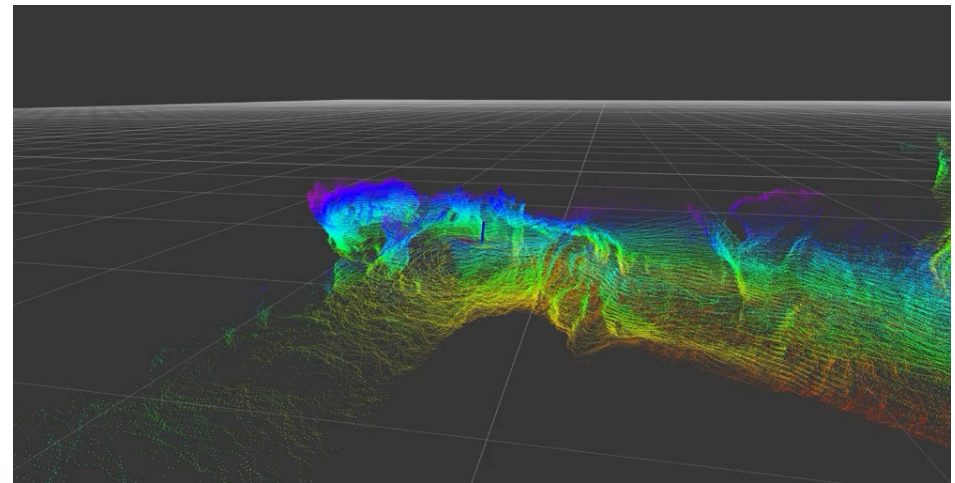

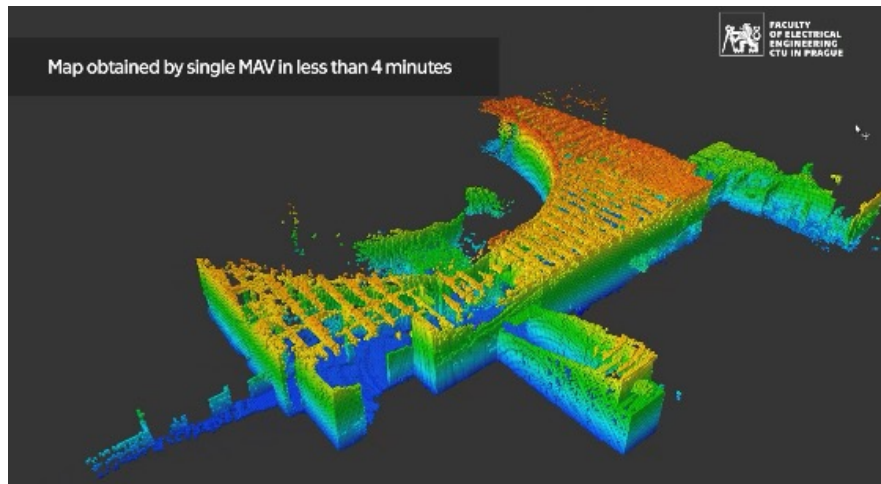

T. Lee, M. Leok, N. McClamroch, "Geometric Tracking Control of a Quadrotor UAV on SE(3)," *CDC, 2010*.

Towards fully autonomous aerial robots – necessary SW components

- State estimation and localization (week 3)
 - Control and motion planning (week 2)
 - **Mapping** (week 4)
 - Planning (week 4)
- ✓ To allow autonomous robots deployment in unknown environments
 - ✓ To gain and collect data from onboard sensors into a map
 - ✓ To process the data for efficient planning of trajectories and reasoning about the environment
 - ✓ Various sensors – 2D & 3D LiDARs, cameras, ...
 - ✓ In exploration, the map may be a result of the mission

[Classification of UAVs](#)

Towards autonomous UAVs

[Autonomous UAV structure](#)

[Conclusion](#)

- State estimation and localization (week 3)
- Control and motion planning (week 2)
- Mapping (week 4)
- **Planning** (week 4)
 - ✓ To get from A to B in an environment with obstacles
 - ✓ Path planning: finding a sequence (discrete) of positions of the robot or a curve (continuous)
 - ✓ 2D or 3D path planning
 - ✓ Trajectory planning: finding a sequence/curve in the configuration space C_{free}
 - ✓ Optimal planning: finding an optimal path or trajectory (optimization criteria: length, flight time, power consumption, distance to obstacles, ...)

UAV sensors to achieve autonomy

- Frame, airframe
 - **Sensors**
 - Onboard computers
 - Flight controllers
 - Actuators (motors)
- ✓ GNSS - Global Navigation Satellite System
 - ✓ Motion capture systems (mocap or mo-cap)
 - ✓ Relatively simple state-estimation and localization
 - ✓ GNSS denied – no global localization available

UAV sensors to achieve autonomy

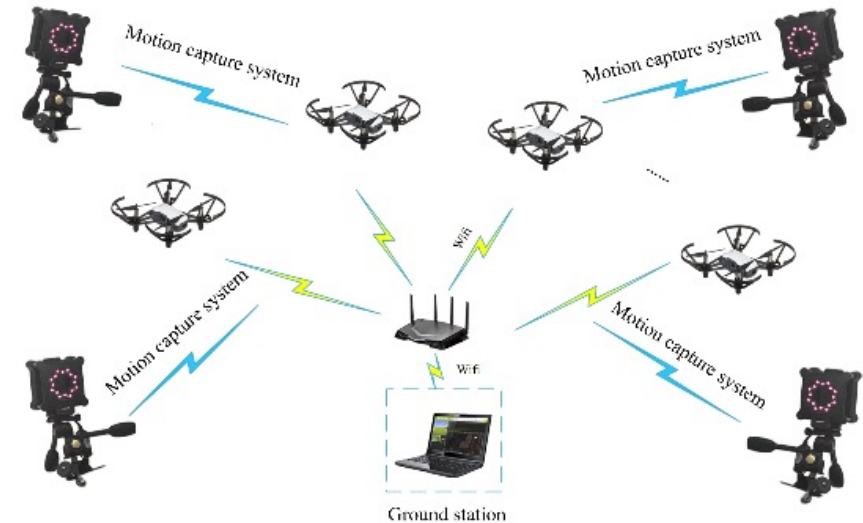

- Frame, airframe
 - **Sensors**
 - Onboard computers
 - Flight controllers
 - Actuators (motors, manipulators)
- ✓ **RGB cameras:** light-weight, low power consumption, high bandwidth, demanding processing, illumination sensitive. Monocular Simultaneous Localization and Mapping (SLAM), Visual-Inertial Odometry (VIO), Optic Flow (OF), Convolutional Neural Network (CNN), ...
 - ✓ **Stereo (3D) cameras:** larger dimensions (range depends on a baseline), low power consumption, high bandwidth, demanding processing, sensitive to number of image features. 3D SLAM, 3D mapping, obstacle detection and avoidance
 - ✓ **Time-of-flight (ToF) cameras:** less demanding processing, sensitive to sun light

RealSense 3D camera

Nerian 3D camera

Terabee ToF camera

UAV sensors to achieve autonomy

- Frame, airframe
- **Sensors**
- Onboard computers
- Flight controllers
- Actuators (motors, manipulators)

- ✓ **1D LiDARs:** light-weight, low power consumption, low bandwidth, simple processing. Height above ground or from ceiling estimation, simple bumper.
- ✓ **2D LiDARs:** larger dimensions, low power consumption, low range. 2D SLAM, 2D mapping, obstacle detection and avoidance.
- ✓ **3D LiDARs:** heavy, high power consumption, high bandwidth, higher range. 3D SLAM, 3D mapping, 3D model reconstruction, robust obstacle detection and avoidance.

[Martin Saska](#)

[Basic terminology](#)

[Classification of UAVs](#)

[Towards autonomous UAVs](#)

Autonomous UAV structure

[Conclusion](#)

- Frame, airframe
 - **Sensors**
 - Onboard computers
 - Flight controllers
 - Actuators (motors, manipulators)
- ✓ **Radars:** under intensive development, high-range, difficult processing. Sense and avoid, obstacle avoidance, target tracking, SLAM.
 - ✓ **Event based cameras:** high range of illumination, sensitive to small changes of detected light intensity by each pixel. SLAM in bad light conditions.
 - ✓ **Thermal and multi-spectral cameras:** heavier, expensive, high bandwidth. Specialized inspection, object of interest localization.

Echodyne radar

UAV sensors to achieve autonomy

- Frame, airframe
- **Sensors**
- Onboard computers
- Flight controllers
- Actuators (motors, manipulators)

- ✓ **UWB:** Ultra wideband beacons in the environment or onboard of robots. Short range, small operational space. Indoor localization, mutual localization in multi-robot systems – week 9.
- ✓ **Vision with active markers:** requires onboard omnidirectional cameras and light sources, onboard processing, reliable detection. Mutual localization in multi-robot systems. **UVDAR.**

V. Walter, ..., M. Saska, "UVDAR System for Visual Relative Localization With Application to Leader-Follower Formations of Multirotor UAVs.," *IEEE RAL*, 2019.

UAV onboard computers

- Frame, airframe
 - Sensors
 - **Onboard computers**
 - Flight controllers
 - Actuators (motors, manipulators)
- ✓ GNSS available - microcontroller inside a flight-controller: state estimation and control using low bandwidth sensors (IMU, GNSS...)
 - ✓ GNSS denied – sensors processing (images, 3D LiDARs), mapping (filtering and fusing sensory data), control and motion planning, trajectory planning, high-level planning, processing for applications

More powerful PC. Often with Linux, e.g. Intel NUC, raspberry, odroid (embedded computers). Image processing: NVIDIA Jetson, AI modules for depth NN

Source: Intel

Source: NVIDIA

UAV flight controllers

- Frame, airframe
 - Sensors
 - Onboard computers
 - **Flight controllers (autopilots)**
 - Actuators (motors, manipulators)
- ✓ Provides low level control inputs (a speed reference signal) for ESCs (Electronic Speed Controller) attached to each motor
 - ✓ Direct control by a remote radio controller, planning and navigation through a set of GNSS points (e.g. QGroundControl), interface with the onboard computer (e.g. MAVLink – MAV communication protocol)
 - ✓ Open-source: Pixhawk (PX4, ArduPilot), Paparazzi, OpenPilot, Betaflight
 - ✓ Commercial (closed) solutions: DJI, ... all commercially available UAVs
 - ✓ Integration with low bandwidth sensors - IMU, GPS, Range finder

Source: ardupilot.org

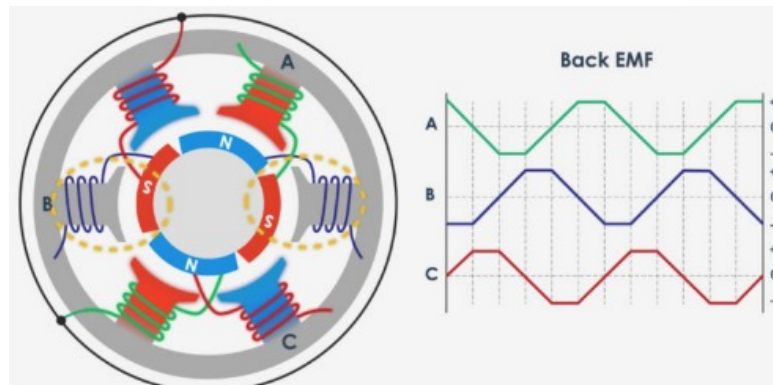

Source: docs.px4.io

ESC with a brushless motor
Source: Racestar

UAV propulsion system

- Frame, airframe
 - Sensors
 - Onboard computers
 - Flight controllers
 - **Actuators (motors, manipulators)**
- ✓ Propulsion system: motor- propeller sets
 - ✓ Larger propellers - more thrust, better efficiency, bigger payload
 - ✓ Smaller propellers - compact design
 - ✓ Motors: BLDC (BrushLess DC) design
 - ✓ DC from a battery is converted in ESC into three-phase alternating current with a variable frequency. ESC is actively tracking the motor rotations and setting the required throttle of each motor

UAV manipulators/arms

- Frame, airframe
 - Sensors
 - Onboard computers
 - Flight controllers
 - **Actuators (motors, manipulators)**
- ✓ Manipulators: to enable physical interaction with environment
 - ✓ Robotic arms, dual arms, tactile force sensors, grippers, launchers

UAV manipulators/arms

- Frame, airframe
 - Sensors
 - Onboard computers
 - Flight controllers
 - **Actuators (motors, manipulators)**
- ✓ Manipulators: to enable physical interaction with environment.
 - ✓ Robotic arms, dual arms, tactile force sensors, grippers, launchers

D. Smrcka, ..., M. Saska, "Admittance Force-Based UAV-Wall Stabilization and Press Exertion for Documentation and Inspection of Historical Buildings.," *In ICUAS, 2021*.

Conclusion

- The main software components that need to be designed for achieving a full autonomy are: State estimation and localization, control and motion planning, mapping, and planning.
- The real-world deployment may require much more: High-level planning and reasoning, task assignment, environment exploration, fully actuated control, human-robot interaction, image processing, reinforcement learning, communication, failure detection and recovery, and **multi-robot coordination**.
- The main hardware components of an autonomous vehicle are: Frame (size~payload), sensors (for the autonomy and for the mission), onboard computers, flight controller, and actuators (motors, manipulators).
- But there is many more onboard of UAVs: power source (batteries, petrol engine, hybrid), communication module, parachute, lights, responder (for sense and avoid and traffic management).
