

Multirotor UAV state estimation and localization

B(E)3M33MRS — Aerial Multi-Robot Systems

Ing. Tomáš Báča, Ph.D.

Multi-Robot Systems group, Faculty of Electrical Engineering
Czech Technical University in Prague

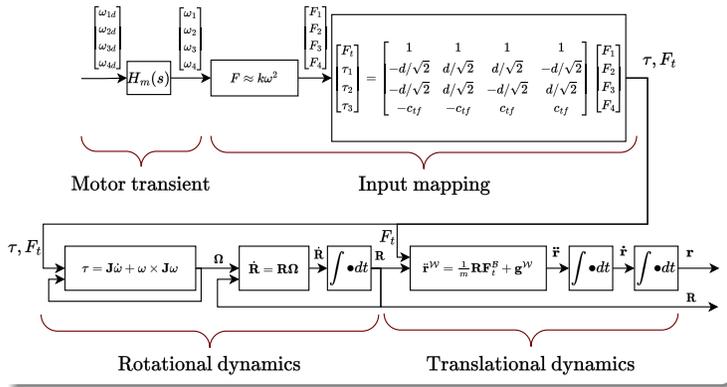

Obtaining UAV state for feedback control and autonomous navigation?

Closing the loop

- How to obtain
 - position \mathbf{r} ,
 - velocity $\dot{\mathbf{r}}$,
 - acceleration $\ddot{\mathbf{r}}$,
 - orientation \mathbf{R} ,
 - angular velocity $\boldsymbol{\omega}$.

Multicopter UAV dynamics model (Lecture 02)

State estimator

- State estimator is often called state observer in the context of control systems.

Robot's current state

- Robot's belief of its current state.
- Probability Distribution Function (PDF), often multivariate normal distribution.

Robot's motion model

- Allows to predict robot's future state based on the current state and input.
- Transforms the *current state* distribution, based on input.

Robot's sensor model

- Allows to incorporate measurements into the current state probabilistically.
- Allows to create artificial measurements based on the world model and the robot's state.

[1] S. Thrun, W. Burgard, and D. Fox, *Probabilistic robotics*. Cambridge, Mass.: MIT Press, 2005

Linear Kalman Filter

Probabilistic state estimation and localization

Robot's current state

- Robot's belief of its current state.
- Probability Distribution Function (PDF), often multivariate normal distribution.

Robot's motion model

- Allows to predict robot's future state based on the current state and input.
- Transforms the current state distribution, based on input.

Robot's sensor model

- Allows to incorporate measurements into the current state probabilistically.
- Allows to create artificial measurements based on the world model and the robot's state.

[1] S. Thrun, W. Burgard, and D. Fox, *Probabilistic robotics*. Cambridge, Mass.: MIT Press, 2005

- All three models are considered to be **stochastic**.

Robot's state is *complete*

- Robot's state at the time step k is all we need to predict the future:

$$p(\mathbf{x}_{[k]} | \mathbf{x}_{[0:k-1]}, \mathbf{u}_{[1:k]}, \mathbf{z}_{[1:k-1]}) \rightarrow p(\mathbf{x}_{[k]} | \mathbf{x}_{[k-1]}, \mathbf{u}_{[k-1]}). \quad (1)$$

- The measurement of robot's state is conditionally independent on the previous states:

$$p(\mathbf{z}_{[k]} | \mathbf{x}_{[0:k-1]}, \mathbf{u}_{[1:k]}, \mathbf{z}_{[1:k-1]}) \rightarrow p(\mathbf{z}_{[k]} | \mathbf{x}_{[k]}). \quad (2)$$

- Robot's state at the time step k is all we need to predict the future:

$$p(\mathbf{x}_{[k]} | \mathbf{x}_{[0:k-1]}, \mathbf{u}_{[1:k]}, \mathbf{z}_{[1:k-1]}) \rightarrow p(\mathbf{x}_{[k]} | \mathbf{x}_{[k-1]}, \mathbf{u}_{[k-1]}) \quad (1)$$

- The measurement of robot's state is conditionally independent on the previous states:

$$p(\mathbf{z}_{[k]} | \mathbf{x}_{[0:k-1]}, \mathbf{u}_{[1:k]}, \mathbf{z}_{[1:k-1]}) \rightarrow p(\mathbf{z}_{[k]} | \mathbf{x}_{[k]}) \quad (2)$$

- Gauss-Markov assumption states that the future and past states are decorrelated given the current state.

Robot's state is *complete*

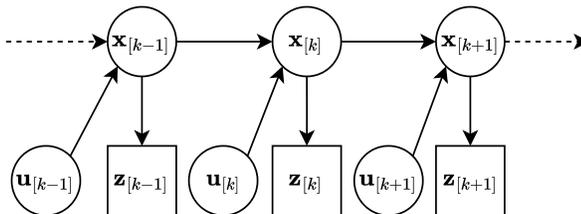

- Robot's state at the time step k is all we need to predict the future:

$$p(\mathbf{x}_{[k]} | \mathbf{x}_{[0:k-1]}, \mathbf{u}_{[1:k]}, \mathbf{z}_{[1:k-1]}) \rightarrow p(\mathbf{x}_{[k]} | \mathbf{x}_{[k-1]}, \mathbf{u}_{[k-1]}). \quad (1)$$

- The measurement of robot's state is conditionally independent on the previous states:

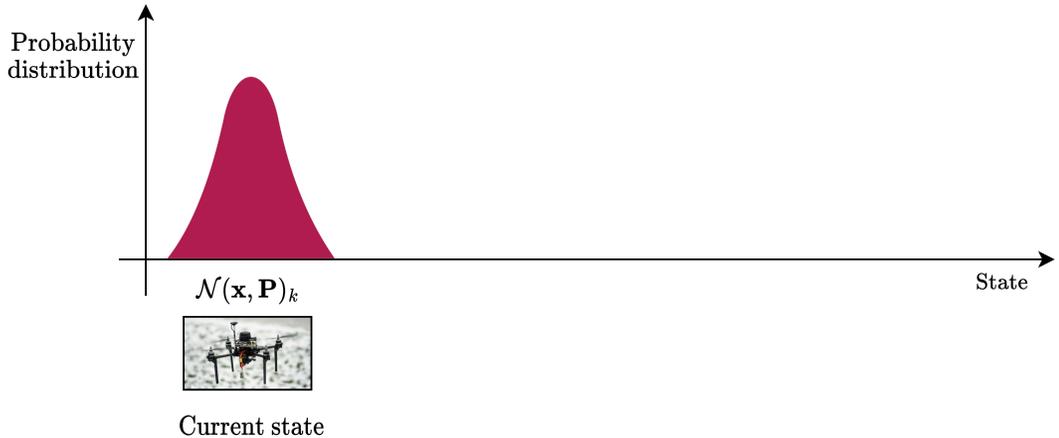

$$p(\mathbf{z}_{[k]} | \mathbf{x}_{[0:k-1]}, \mathbf{u}_{[1:k]}, \mathbf{z}_{[1:k-1]}) \rightarrow p(\mathbf{z}_{[k]} | \mathbf{x}_{[k]}). \quad (2)$$

Gauss-Markov assumption for stochastic systems

- Gauss-Markov assumption states that the future and past states are decorrelated given the current state.

Localization

Global
localization

Local
localization

- Developed in \approx 1960 at NASA.
- Optimal state estimator for linear models.
- Minimum Mean-Square Error estimator.

Models

- State: Multivariate Gaussian
- Sensor model: added noise $\mathcal{N}(\mathbf{0}, \mathbf{R})$
- Motion model: linear model with added noise $\mathcal{N}(\mathbf{0}, \mathbf{Q})$

Two-stage algorithm

- **Prediction:** propagation of robot's state and its uncertainty through the model.
- **Correction:** update of the robot's state and its uncertainty using measurements.

How to derive it?

- B3M35OFD, Estimation, filtering and detection

Estimator for the Linear Time Invariant (LTI) system

Discrete stochastic LTI System

- State at the time step k : $\mathbf{x}_{[k]} \in \mathbb{R}^n$.
- Input at the time step k : $\mathbf{u}_{[k]} \in \mathbb{R}^m$.

$$\mathbf{x}_{[k+1]} = \mathbf{A}\mathbf{x}_{[k]} + \mathbf{B}\mathbf{u}_{[k]} + \mathbf{w}_{[k]}, \quad (3)$$

where:

- System matrix: $\mathbf{A} \in \mathbb{R}^{n \times n}$,
- Input matrix: $\mathbf{B} \in \mathbb{R}^{n \times m}$,
- Process noise $\mathbf{w}_{[k]} \sim \mathcal{N}(\mathbf{0}, \mathbf{Q})$,
- Process covariance matrix: $\mathbf{Q} \in \mathbb{R}_{>0}^{n \times n}$.

Measurement model

- Vector of measurements: $\mathbf{z} \in \mathbb{R}^p$.

$$\mathbf{z}_{[k]} = \mathbf{H}\mathbf{x}_{[k]} + \mathbf{v}_{[k]}, \quad (4)$$

where:

- Measurement-state mapping: $\mathbf{H} \in \mathbb{R}^{p \times n}$,
- Measurement noise: $\mathbf{v}_{[k]} \sim \mathcal{N}(\mathbf{0}, \mathbf{R})$,
- Measurement noise covariance: $\mathbf{R} \in \mathbb{R}_{>0}^{p \times p}$.

Goal of the estimator

To estimate the tuple $\mathbf{x}_{[k]}^*$, $\mathbf{P}_{[k]}$, where

- $\mathbf{x}_{[k]}^*$ is the state vector estimate,
- $\mathbf{P}_{[k]} \in \mathbb{R}^{n \times n}$ is the state covariance.

Lecture 3: UAV localization

State estimators and Filters

Linear Kalman Filter

Estimator for the LTI system

Discrete stochastic LTI System

- State at the time step k : $\mathbf{x}_{[k]} \in \mathbb{R}^n$.
- Input at the time step k : $\mathbf{u}_{[k]} \in \mathbb{R}^m$.

$$\mathbf{x}_{[k+1]} = \mathbf{A}\mathbf{x}_{[k]} + \mathbf{B}\mathbf{u}_{[k]} + \mathbf{w}_{[k]}, \quad (3)$$

where:

- System matrix: $\mathbf{A} \in \mathbb{R}^{n \times n}$,
- Input matrix: $\mathbf{B} \in \mathbb{R}^{n \times m}$,
- Process noise $\mathbf{w}_{[k]} \sim \mathcal{N}(\mathbf{0}, \mathbf{Q})$,
- Process covariance matrix: $\mathbf{Q} \in \mathbb{R}_{>0}^{n \times n}$.

Measurement model

- Vector of measurements: $\mathbf{z} \in \mathbb{R}^p$.

$$\mathbf{z}_{[k]} = \mathbf{H}\mathbf{x}_{[k]} + \mathbf{v}_{[k]}, \quad (4)$$

where:

- Measurement-state mapping: $\mathbf{H} \in \mathbb{R}^{p \times n}$,
- Measurement noise: $\mathbf{v}_{[k]} \sim \mathcal{N}(\mathbf{0}, \mathbf{R})$,
- Measurement noise covariance: $\mathbf{R} \in \mathbb{R}_{>0}^{p \times p}$.

Goal of the estimator

- To estimate the tuple $\mathbf{x}_{[k]}^*$, $\mathbf{P}_{[k]}$, where
- $\mathbf{x}_{[k]}^*$ is the state vector estimate.
 - $\mathbf{P}_{[k]} \in \mathbb{R}^{n \times n}$ is the state covariance.

Prediction

- Given $\mathbf{x}_{[k]}^*$, $\mathbf{P}_{[k]}$, $\mathbf{u}_{[k]}$:

$$\mathbf{x}_{[k+1]}^* = \mathbf{A}\mathbf{x}_{[k]}^* + \mathbf{B}\mathbf{u}_{[k]} \quad (5)$$

$$\mathbf{P}_{[k+1]} = \mathbf{A}\mathbf{P}_{[k]}\mathbf{A}^T + \mathbf{Q} \quad (6)$$

Correction

- Given $\mathbf{P}_{[k]}$, calculate the *Kalman gain*:

$$\mathbf{K}_{[k]} = \mathbf{P}_{[k]}\mathbf{H}^T (\mathbf{H}\mathbf{P}_{[k]}\mathbf{H}^T + \mathbf{R})^{-1} \quad (7)$$

- Given $\mathbf{x}_{[k]}^*$, $\mathbf{P}_{[k]}$, $\mathbf{z}_{[k]}$, $\mathbf{K}_{[k]}$, update the state and its covariance:

$$\mathbf{x}_{[k]}^* := \mathbf{x}_{[k]}^* + \mathbf{K}_{[k]} (\mathbf{z}_{[k]} - \mathbf{H}\mathbf{x}_{[k]}^*), \quad (8)$$

$$\mathbf{P}_{[k]} := (\mathbf{I} - \mathbf{K}_{[k]}\mathbf{H})\mathbf{P}_{[k]}, \quad (9)$$

Linear Kalman Filter (LKF)

The "synchronous" LKF cycle

The cycle evaluation rate?

- At the mercy of the incoming measurements.

The "asynchronous" LKF cycle

- Prediction step executed at fixed rate.
- Correction step executed on demand.

Lecture 3: UAV localization

State estimators and Filters

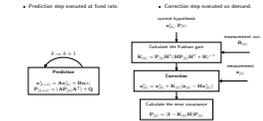

Linear Kalman Filter

Linear Kalman Filter (LKF)

2024-10-07

Linear Kalman Filter (LKF)

The "asynchronous" LKF cycle

- More often, the prediction and correction happen asynchronously.
- Corrections can be even caused by variety of sources at different rate.
- The prediction step is often being evaluated at fixed rate. The state obtained at the prediction step is used for control.

Estimating hidden states

- Hidden states are often used to model sensor biases.
- LKF can estimate them if they are observable.

LTI System diagram

Example LTI system, $\Delta t = 0.01$ s

$$\mathbf{x} = \begin{bmatrix} r \\ \dot{r} \\ \dot{r}_b \\ \dot{r}_i \end{bmatrix}, \mathbf{u} = [\dot{r}_d], \quad (15)$$

$$\mathbf{A} = \begin{bmatrix} 1.0 & 0.01 & 0.0 & 0.0 \\ 0.0 & 0.0 & 1.0 & 1.0 \\ 0.0 & 0.0 & 1.0 & 0.0 \\ 0.0 & 0.0 & 0.0 & 0.99 \end{bmatrix}, \mathbf{B} = \begin{bmatrix} 0 \\ 0 \\ 0 \\ 0.01 \end{bmatrix}. \quad (16)$$

Linear Kalman Filter (LKF) — Example 2

Estimating hidden states

- Hidden states are often used to model sensor biases.
- LKF can estimate them if they are observable.

LTI System diagram

Example LTI system, $\Delta t = 0.01$ s

$$\mathbf{x} = \begin{bmatrix} r \\ \dot{r} \\ \dot{r}_b \\ \dot{r}_i \end{bmatrix}, \mathbf{u} = [\dot{r}_d], \quad (15)$$

$$\mathbf{A} = \begin{bmatrix} 1.0 & 0.01 & 0.0 & 0.0 \\ 0.0 & 0.0 & 1.0 & 1.0 \\ 0.0 & 0.0 & 1.0 & 0.0 \\ 0.0 & 0.0 & 0.0 & 0.99 \end{bmatrix}, \mathbf{B} = \begin{bmatrix} 0 \\ 0 \\ 0 \\ 0.01 \end{bmatrix}. \quad (16)$$

- Sensor bias estimation is heavily used to estimate nonzero offsets of sensors such as gyroscopes and accelerometers.
- Wind speed can be estimated as a bias in UAV acceleration.

What if we have a non-linear model?

- UAV Rotational dynamics.
- Ackermann vehicle.
- Differential car-like model.
- ... almost anything engineering-related in the real world.

Linearization?

- Needs an operation point.
- A single operation point is hard-to-find with most models.

Let's linearize more

- Extended Kalman Filter (EKF).
- De-facto standard in aviation and inertial navigation.

Discrete stochastic system

- State at the time step k : $\mathbf{x}_{[k]} \in \mathbb{R}^n$.

- Input at the time step k : $\mathbf{u}_{[k]} \in \mathbb{R}^m$.

$$\mathbf{x}_{[k+1]} = f(\mathbf{x}_{[k]}, \mathbf{u}_{[k]}) + \mathbf{w}_{[k]} \quad (17)$$

where

- $f()$ is differentiable,

- Process noise $\mathbf{w}_{[k]} \sim \mathcal{N}(\mathbf{0}, \mathbf{Q})$,

- Process covariance matrix: $\mathbf{Q} \in \mathbb{R}_{>0}^{n \times n}$.

Measurement model

- Vector of measurements: $\mathbf{z} \in \mathbb{R}^p$.

$$\mathbf{z}_{[k]} = h(\mathbf{x}_{[k]}) + \mathbf{v}_{[k]} \quad (18)$$

where

- Measurement-state mapping: $h(): \mathbb{R}^n \rightarrow \mathbb{R}^p$ is differentiable,

- Measurement noise: $\mathbf{v}_{[k]} \sim \mathcal{N}(\mathbf{0}, \mathbf{R})$,

- Measurement noise covariance: $\mathbf{R} \in \mathbb{R}_{>0}^{p \times p}$.

Prediction

- Given $\mathbf{x}_{[k]}^*$, $\mathbf{P}_{[k]}$, $\mathbf{u}_{[k]}$:

$$\mathbf{x}_{[k+1]}^* = f(\mathbf{x}_{[k]}^*, \mathbf{u}_{[k]}) \quad (19)$$

$$\mathbf{P}_{[k+1]} = \mathbf{F}_{[k]} \mathbf{P}_{[k]} \mathbf{F}_{[k]}^T + \mathbf{Q}, \quad (20)$$

where

$$\mathbf{F}_{[k]} = \left. \frac{\partial f}{\partial \mathbf{x}} \right|_{\mathbf{x}_{[k]}^*, \mathbf{u}_{[k]}} \quad (21)$$

is the Jacobian of $f()$ evaluated at the $\mathbf{x}_{[k]}^*$, $\mathbf{u}_{[k]}$.

Correction

- Given $\mathbf{P}_{[k]}$, calculate the *Kalman gain*:

$$\mathbf{K}_{[k]} = \mathbf{P}_{[k]} \mathbf{H}_{[k]}^T \left(\mathbf{H}_{[k]} \mathbf{P}_{[k]} \mathbf{H}_{[k]}^T + \mathbf{R} \right)^{-1}. \quad (22)$$

- Given $\mathbf{x}_{[k]}^*$, $\mathbf{P}_{[k]}$, $\mathbf{z}_{[k]}$, $\mathbf{K}_{[k]}$, update the state and its covariance:

$$\mathbf{x}_{[k]}^* := \mathbf{x}_{[k]}^* + \mathbf{K}_{[k]} \left(\mathbf{z}_{[k]} - h(\mathbf{x}_{[k]}^*) \right), \quad (23)$$

$$\mathbf{P}_{[k]} := (\mathbf{I} - \mathbf{K}_{[k]} \mathbf{H}_{[k]}) \mathbf{P}_{[k]}, \quad (24)$$

where

$$\mathbf{H}_{[k]} = \left. \frac{\partial h}{\partial \mathbf{x}} \right|_{\mathbf{x}_{[k]}^*} \quad (25)$$

is the Jacobian of $h()$ evaluated at the $\mathbf{x}_{[k]}^*$.

Unscented Kalman Filter

- Published in early 2000s by Uhlmann et al.
- Uses the full nonlinear model $f()$, $h()$.
- Does not linearize, therefore, $f()$, $h()$ can be arbitrary.
- More *elegant solution* than EKF.
- More *robust* than EKF.

Unscented Transform

Unscented Transform

Unscented transform — reconstruction of the transformed Gaussian PDF

- UT preserves 1st, 2nd and 3rd moment of the Gaussian PDF.
- The new mean (\mathbf{x}) is obtained by weighted sum of the *sigma* points using *first-order weights*.
- The new covariance (\mathbf{P}) is obtained by weighted sum of the *sigma* points using *second-order weights*.

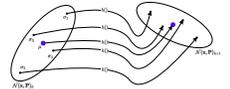

Lecture 3: UAV localization

- The new mean (\mathbf{x}) is obtained by weighted sum of the sigma points using first-order weights.
- The new covariance (\mathbf{P}) is obtained by weighted sum of the sigma points using second-order weights.

Prediction step

1. Calculate the *sigma* points for $\mathbf{x}_{[k]}^*, \mathbf{P}_{[k]}$.
2. Propagate the *sigma* points through $f(\cdot)$.
3. Reconstruct $\mathbf{x}_{[k+1]}^*, \mathbf{P}_{[k+1]}$

Correction step

1. Calculate the *sigma* points for $\mathbf{x}_{[k]}^*, \mathbf{P}_{[k]}$.
2. Propagate the *sigma* points through $h(\cdot)$ to obtain the expected measurement \mathbf{z}^* .
3. Reconstruct the mean and covariance of the expected measurement.
4. Calculate cross-covariance between the measurement \mathbf{z} and the expected measurement \mathbf{z}^* .
5. Calculate the Kalman gain using the cross-covariance.
6. Update the mean and covariance \mathbf{x}^*, \mathbf{P} .

Unscented Kalman Filter (UKF) — example 2

State estimation of a car

- Nonlinear car-like model (similar to the previous example).
- Unscented Kalman Filter.
- Car observed by a single camera.

[3] T. Baca, P. Stepan, B. Spurny, D. Hert, R. Penicka, M. Saska, *et al.*, "Autonomous Landing on a Moving Vehicle with an Unmanned Aerial Vehicle," *Journal of Field Robotics*, vol. 36, pp. 874–891, 5 2019

Rotation+translation Dynamics model

$$\boldsymbol{\tau} = \mathbf{J}\dot{\boldsymbol{\omega}} + \boldsymbol{\omega} \times \mathbf{J}\boldsymbol{\omega} \quad (29)$$

$$\dot{\mathbf{R}} = \mathbf{R}\boldsymbol{\Omega} \quad (30)$$

$$\ddot{\mathbf{r}}^{\mathcal{W}} = \frac{1}{m}\mathbf{R}\mathbf{F}_t^{\mathcal{B}} + \mathbf{g}^{\mathcal{W}} \quad (31)$$

What do we need?

- Angular velocity: $\boldsymbol{\omega}^{\mathcal{B}}$.
- Orientation: \mathbf{R} .

State estimator

- a) Complementary filter
- b) EKF
- Often based on quaternions.
- Bias estimation for all the sensors.

UAV Onboard Sensors

- Gyroscope:
 - 3-axis MEMS.
 - **Measured intrinsic angular rate.**
 - Sufficient for attitude rate control.
- Accelerometer:
 - 3-axis MEMS.
 - **Measures proper acceleration.**
 - Gravity model might be needed for precise navigation.
- "Magnetometer":
 - 3-axis
 - **Measures external magnetic field.**
 - Magnetic field model needed for precise navigation.
- All above are often part of the Inertial Measurement Unit (IMU).
- All above need calibration.
- All above benefit from temperature stabilization.

$$\boldsymbol{\tau} = \mathbf{J}\dot{\boldsymbol{\omega}} + \boldsymbol{\omega} \times \mathbf{J}\boldsymbol{\omega} \quad (29)$$

$$\dot{\mathbf{R}} = \mathbf{R}\boldsymbol{\Omega} \quad (30)$$

$$\ddot{\mathbf{r}}^{\mathcal{W}} = \frac{1}{m}\mathbf{R}\mathbf{F}_t^{\mathcal{B}} + \mathbf{g}^{\mathcal{W}} \quad (31)$$

- Angular velocity $\boldsymbol{\omega}^{\mathcal{B}}$.
- Orientation \mathbf{R} .

- (i) Complementary filter
- (ii) EKF
- Often based on quaternions.
- Bias estimation for all the sensors.

- Gyroscope:
 - 3-axis MEMS.
 - **Measured intrinsic angular rate.**
 - Sufficient for attitude rate control.
- Accelerometer:
 - 3-axis MEMS.
 - **Measures proper acceleration.**
 - Gravity model might be needed for precise navigation.
- "Magnetometer":
 - 3-axis
 - **Measures external magnetic field.**
 - Magnetic field model needed for precise navigation.
- All above are often part of the Inertial Measurement Unit (IMU).
- All above need calibration.
- All above benefit from temperature stabilization.

Etymology

Odo-metry = Measuring of steps → measuring of where we are based on the steps we took.

Ground robot analogy

- Ground robots have encoders in their wheels.
- Encoders' outputs represent intrinsic velocity.
- Integrating encoders from the last known position is called **dead reckoning**.

Can we do *odometry* using the IMU

- Not in general: double-integration of acceleration will drift with increasing velocity.
- Can be done with very precise instruments and models: in aerospace.
- Definitely not with the consumer-level sensors in most UAVs: **would not lead to a stable flight**.

How can we do odometry then?

- We need to go derivative higher from acceleration: to **velocity**.

- To be complete: double integration of acceleration will lead to quadratic drift in position, if the accelerometer exhibits non-zero bias.

Optical flow

- Means of calculating velocity from RGB camera footage.
- Downwards-facing camera.
- Requires distance measurement to fix the absolute velocity.
- Very common on most commercial platforms.
- Parrot AR Drone (2010)
- **Relatively robust.**
- **Not very accurate.**

PX4 Flow

- Ultrasound rangefinder
- GreyScale camera
- Embedded μ controller

Flowdeck v2

- IR ToF rangefinder
- GreyScale camera
- Embedded μ controller

Optical flow

Odometry on UAVs — Optical Flow

Visual Inertial Odometry

- Combination of feature matching and IMU predictions.
- **Does not require a rangefinder.**
- Requires proper camera calibration.
- Requires high-resolution and high-rate cameras.
- Global shutter is necessary.
- Robustness is still to be desired (for UAVs).

Features detectors:

- Invariance in transformations and lighting.
- Edges, Corners, Blobs.
- SURF, FAST, SIFT, MSER (Matas et al. [4]).

Feature descriptors:

- SURF, SIFT, BRIEF.

Feature matching [5]

LiDAR

- 2D or 3D.
- Active sensor: Infra-red.
- Scans the environment in stacked rings.
- Has mechanical parts.
- Requires obstacles to be close.

PointCloud data structure

- Organized/unorganized list of 3D points.
- Can contain meta information (reflectivity, color).

PointCloud features

- 3D corners, 3D edges.
- Facets of polyhedra.

Ouster LiDAR Field of View

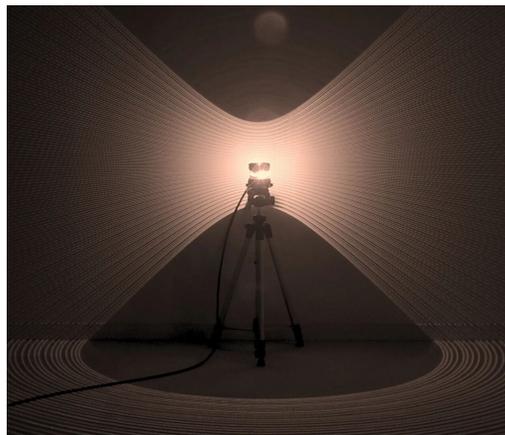

Figure 1: source: <http://ouster.com>

- 2D or 3D.
- Active sensor: Infra-red.
- Scans the environment in stacked rings.
- Has mechanical parts.
- Requires obstacles to be close.

- Organized/unorganized list of 3D points.
- Can contain meta information (reflectivity, color).

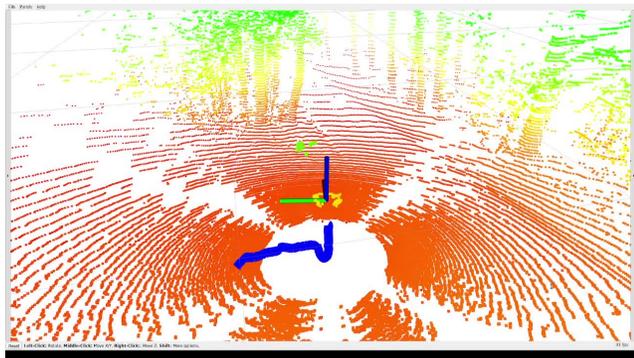

- 3D corners, 3D edges.
- Facets of polyhedra.

Iterative Closest Point (ICP)

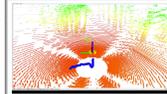

- Pointcloud registration method.
- Assumption: Not that many points have changed between two consecutively-measured point clouds.
- Minimizing sum of squares of the closest points on two pointclouds.
- Many variants and implementations exist.
- Outlier rejection is important.
- Algorithm:
 1. compute point-to-point correspondences,
 2. optimize for the rotation and translation,
 3. move the pointcloud,
 4. repeat.

Localization

The means of obtaining the 3D position of the robot in the world coordinate frame.

Why?

- Global localization is needed for global navigation:
 - for building accurate 3D maps of the environment,
 - for using the maps for navigation.
- Localization is needed for any meaningful interaction of a robot with its world.

Where is the state of the art?

- Depends heavily on the use case.

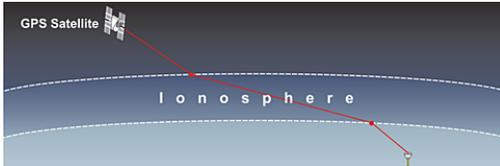

Global Navigation Satellite System

- Earth's satellite constellations.
- GPS, GLONAS, Galileo, BeiDou.

Properties

- Most-often 10 Hz 3D position output.
- Needs clear sky view.
- Beware of Solar activity (Ionosphere).
- Beware of reflections (buildings).
- Requires magnetometer.

Influence of ionosphere on GNSS

Upgrade: Realtime Kinematics (RTK)

- Works directly with the GPS carrier wave signal.
- Fixed base-station on a tripod for relaying carrier wave phase.
- The UAV is equipped with RTK-compatible antenna and radio receiver.

- The UAV is equipped with RTK-compatible antenna and radio receiver.

- Sensitive to El-Mag interference (USB 3.0).

Marker-based localization

- Pre-set IR camera system.
- IR lighting.
- Retro-reflective markers.
- Popular for control theory research.

Motion capture output

- Rigid body's position and velocity, 200 Hz.
- Almost no noise, can be used directly for feedback.

- These systems are very unreliable and are more suitable for ground vehicles.
- Ground vehicles do not need constant precise localization for stabilization, therefore, they cope much better with measurement outages than UAVs.

SLAM — Simultaneous Localization and Mapping

- Creating a map of a priori unknown environment while being localized in the same map.
- *Chicken-and-egg* problem.
- *The holy grail* problem in mobile robotics.
- Two *options*:
 - Online SLAM — computes the current robot pose.
 - Full SLAM — recovers the whole history of the robot poses.

Popular approaches

- EKF SLAM,
- Fast SLAM (Particle filter),
- PoseGraph SLAM (Bundle Adjustment),
- Factor Graph SLAM.

SLAM — Simultaneous Localization and Mapping

- Creating a map of a priori unknown environment while being localized in the same map.
- *Chicken-and-egg* problem.
- *The holy grail* problem in mobile robotics.
- Two *options*:
 - Online SLAM — computes the current robot pose.
 - Full SLAM — recovers the whole history of the robot poses.

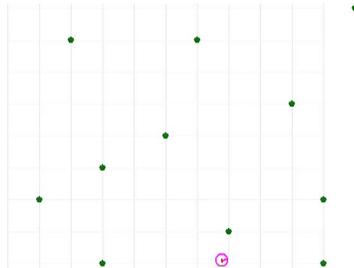

Popular approaches

- EKF SLAM,
- Fast SLAM (Particle filter),
- PoseGraph SLAM (Bundle Adjustment),
- Factor Graph SLAM.

EKF SLAM

- Online SLAM.
- The first SLAM solution, now mostly history.
- The LKF state vector contains:
 - The robot's state (r_x, r_y, r_η) ,
 - The map of landmarks $(l_{x,n}, l_{y,n})$.
- Assumption: landmark association is solved.
- Capable of loop closure (revisiting places should help).
- Computationally intractable for large maps.

2D EKF SLAM Illustration

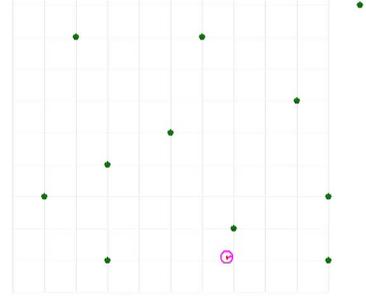

Video: <https://youtu.be/vCVS9WAffi4>

[1] S. Thrun, W. Burgard, and D. Fox, *Probabilistic robotics*. Cambridge, Mass.: MIT Press, 2005

2D EKF SLAM Illustration

Video: <https://youtu.be/vCVS9WAffi4>

Algorithm

1. The state vector and the map are initialized.
2. Prediction step:
 - the robot moves,
 - landmarks are static.
3. Calculation of the expected measurement: which landmarks should be observed and where.
4. Measurement: landmark association.
5. Correction step.
6. Repeat.

4. Measurement: landmark association.
5. Correction step.
6. Repeat.

2D EKF SLAM Illustration

Video: <https://youtu.be/vCVS9WAffi4>

Particle filter

- Monte-Carlo localization method.
- Many *particles* representing the robot's model.
- Does not need landmark association.
- The robot's state hypothesis is statistically drawn from the set of particles.

Particle filter — Illustration

- The initial distribution of the particles is random (uniform).
- The robot recognizes a door, but it does not know which door is it.

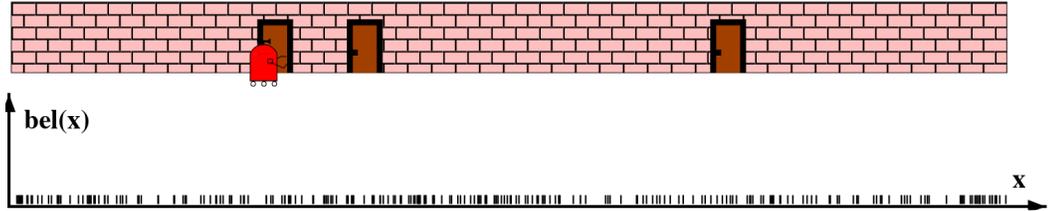

Figure 4: Source: Probabilistic robotics, Thrun et al. [1].

Particle filter

- Monte-Carlo localization method.
- Many particles representing the robot's model.
- Does not need landmark association.
- The robot's state hypothesis is statistically drawn from the set of particles.

Particle filter — Illustration

Figure 4: Source: Probabilistic robotics, Thrun et al. [1].

Particle filter — Illustration

- Weight is put to the particles which could generate such measurements.
- Particles move to *next generation*: weighted particles have higher chance to survive and to *multiply*.

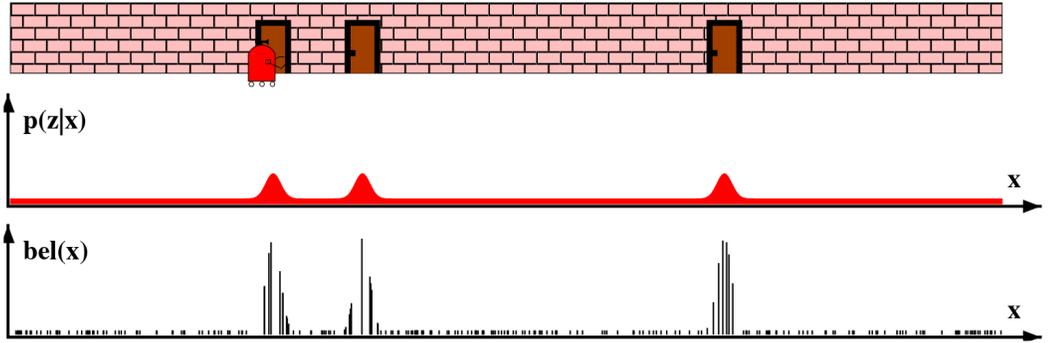

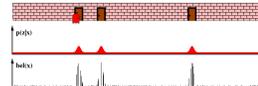

Figure 4: Source: Probabilistic robotics, Thrun et al. [1].

- Weight is put to the particles which could generate such measurements.
- Particles move to next generation: weighted particles have higher chance to survive and to multiply.

Particle filter — Illustration

- The robot moves in the physical world.
- We apply the control input to each particle and move it as well.

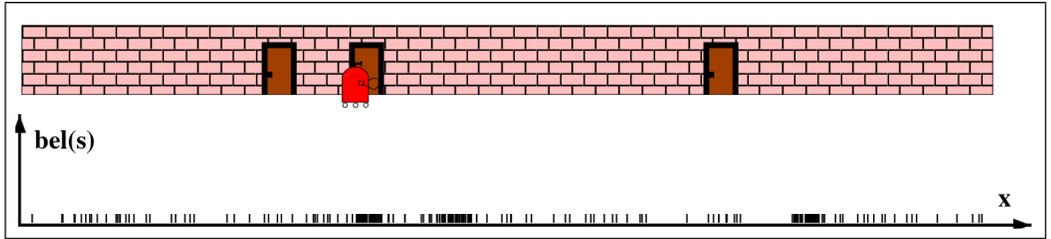

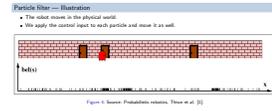

Figure 4: Source: Probabilistic robotics, Thrun et al. [1].

Particle filter — Illustration

- Robot, again, observes a door, but it does not know which door is it.
- Weight is put to the particles which could generate such measurements.

Local UAV Localization — Fast SLAM

Pose graphs

- Special case of a Bayes network.
- Constructed as bi-parted graph.
- Two types of nodes:
 - **poses**,
 - **landmarks**.
- Edges:
 - **motions**: constraints between poses,
 - **observations**: constraints between poses and landmarks.
- Inference from the graph forms a nonlinear least-squares optimization.
- Mostly used by visual SLAMs.
- E.g., ORB-SLAM [6], LSD-SLAM [7].

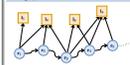

Pose graph illustration

Local UAV Localization — Factor Graph SLAM

Factor graphs

- Special case of a Bayes network.
- Constructed as bi-parted graph.
- Two types of nodes:
 - variables,
 - factors.
- Edges: always connect variable and a factor.
- More types of constraints than in Pose Graph.
 - Constraints originating from IMU,
 - Loop closure constraints,
 - Global navigation constraints (Global Navigation Satellite System (GNSS)).
- Inference from the graph forms a nonlinear least-squares optimization.
- Often used with LiDAR Simultaneous Localization and Mappings (SLAMs).
- E.g., LIO-SAM, MILIOM, LVI-SAM, VIRAL-SLAM.

Masbal [135]	Omnidir	Topo	Map + Loc	Indoors	ASIFT
García-Fidalgo [136]	Mono	Topo	SLAM	In + Out	SURF
García-Fidalgo [137]	Mono	Topo	SLAM	In + Out	SFT

- The research field of visual SLAMs is huge and also very popular.
- Almost everyone can contribute, because you only need a camera to start working.
- Rarely anything works in the real world and onboard a UAV.

Showcase of Visual SLAM — RTAB-Map

Video: <https://youtu.be/G-5jesjNfLc>

Lecture 3: UAV localization

Localization

Local localization

Local UAV Localization — Visual SLAMs

- The video showcases RGBD SLAM.
- RTAB-Map can also utilize other sources of data to build a map, e.g., LiDAR pointclouds.

Showcase of LiDAR SLAM — A-LOAM SLAM

Lecture 3: UAV localization

Localization

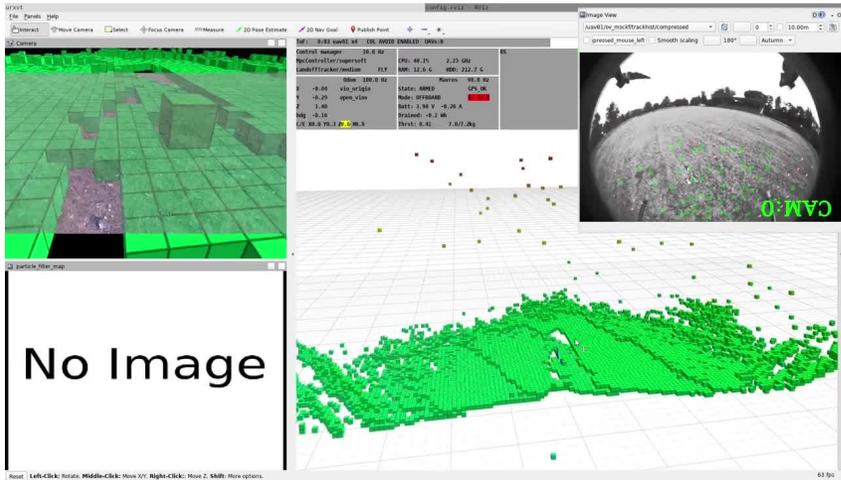

Local localization

Local UAV Localization — LiDAR SLAMs

- The field of LiDAR SLAMs is also very active and rich.
- Similarly, true SLAMs are rarely used on UAVs, mostly due to the SLAMs' computational demands.

Visual odometry and Particle filter re-localization

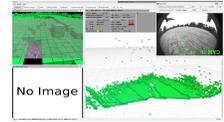

Video: https://youtu.be/Mq10Fu_KqJQ

Lecture 3: UAV localization

Localization

Local localization

Coupled Odometry + Localization

- Open-VINS odometry for fast state estimation.
- Particle filter for re-localization in a known height map.

- UAVs most commonly operate outdoors, therefore, **GNSS localization the most common**.
- Commercial platforms are capable of onboard odometry (most often visual), however, that is used for **stabilization** and to aid human pilots with control in GNSS-denied environments.
- SLAMs are mostly the **subject of research** and are not reliable enough to use the UAVs to their full potential.
- Multi-modal SLAMs and geometries are probably the future. Fusion of different sensor modalities (Visual, LiDAR, Radar, InfraRed) will increase the reliability and robustness.
